Firexcoin -A New Crypto Currency

Singapore, Apr 12, 2020 (Issuewire.com) - Introduction:

Firexcoin is an asset running on the Ethereum (ERC20) network. **Firexcoin** delivers lightning-fast transactions at near 0 fees.

WHAT IS BLOCKCHAIN?

A blockchain is an anonymous online ledger that uses data structure to simplify the way we transact. Blockchain allows users to manipulate the ledger in a secure way without the help of a third party.

A bank's ledger is connected to a centralised network. However, a blockchain is anonymous, protecting the identities of the users. This makes blockchain a more secure way to carry out transactions.

The algorithm used in blockchain reduces the dependence on people to verify the transactions. This technology used for recording various transactions has the potential to disrupt the financial system.
Firexcoin-Pay with Crypto Instantly Anywhere

The easiest and fastest way to make everyday purchases with crypto debit card.

Cryptocurrency usability brought to a whole new level. Global payments enabled anytime and anywhere. Our unique range of products allows you to bring together many types of local and global currencies with the flexibility to choose from different payment methods with a tap of a button. Spend at over 40 million points of acceptance online and offline, in almost 200 countries – perfect for the world traveller. **Secure**

payments

Ethereum uses industry-standard public-key cryptography tools and techniques, which means the code is well tested and well understood. All transactions on the network are public, which means the movement of funds can always be audited. Each transaction is signed by whoever sent it using the Ed25519 algorithm.

Fast transactions

If Block Time of FRX is 15-20 seconds, **FIREXCOIN** Powered by Ethereum (ERC20) Lumens is 2-5 seconds, making it easy to use in everyday life.

Small Transaction Fee

FIREXCOIN is a Small Transaction Fee Ethereum (Gas - 0.00000223 approx)

Worldwide transactions

Moving money across borders quickly, reliably, and for fractions of a penny never has been too easy. With FIREXCOIN now we can connect banks, making payments and trusting people all over the world without worrying about double spending issues.

I prefer **FirexCoin** because it is the first and unique cryptocurrency to provide a platform for users to earn and contribute. They keep their customers' account secure by using state of the art encryption and storing their keys locally in a secure vault on their device. It allows you to use multiple accounts, switch between all of them fluidly. I think adoption is a strong point of this project and a number of factors will play very well, Singapore is part of an emerging market which is generally very friendly with blockchain technology and cryptocurrency is a low-cost solution to the market.**FirexCoin** is a very good and solid project, they raised only the fund they need to achieve their business goal because they are aware of what to develop.

What this project seeks is to facilitate interconnection between chains, reducing costs when making these interactions.

-This project aims to develop financial products such as those already known, Exchange of digital assets and fiat money in addition to a wallet.

-The token created for the platform becomes something like the ether for transactions within the network, and serve as gasoline for the maintenance and use of the network. With the particularity that these will be burned lowering the availability and possibly increasing the price of the token.

-It has as project the development of a mobile wallet and a hardware version of it, in addition to an exchange that allows fast checks and exchanges regardless of the network from which the transfer is made.
