Mireye Partners With Powersite To Create a Plug and Play High Frequency X-Ray Generator

Smart Engineering to Save Time and Money While Serving Patients Better.

Burnaby, British Columbia May 10, 2022 (Issuewire.com**)** - Mireye, an advanced medtech company, and Powersite, a globally recognized medical generator manufacturer, have launched the first plug-and-play high-frequency x-ray generator. The 32-kilowatt generator can be plugged into a regular 110-volt socket creating a simple installation and easy relocation of a digital x-ray system. The generator will be first used in the Mireye AVet40 digital veterinary x-ray system. This will bring further versatility to veterinarian clinics and hospitals along with the advanced features of the system that create an easier and faster workflow. The result is a system that saves time and money while allowing veterinarians to serve more patients better.

“This aligns well with our vision for digital imaging equipment. We are focused on radically improving workflow through advanced technology, but also want to see cumbersome difficult imaging equipment be a thing of the past,” explained Derek Sexton, CEO of Mireye. “This project is additionally a clear example of how we work with partners to better existing technology and help bring to market a much more beneficial user experience. This collaboration with Powersite is a clear example of the value we bring to partnerships and what we strive for.”

The 32-kilowatt high-frequency plug-and-play generator will soon be followed up by a 40-kilowatt version. The 40-kilowatt plug and play generator will be applied to Mireye’s Intelligent Chiropractic Imaging System, due to launch later this year.
