HiBT Launches CFD Trading to Expand Multi-Asset Market Access for Global Users

The live CFD service brings foreign exchange, commodities, precious metals, energy and global indices into a dedicated USDT-based trading framework.

Singapore, Singapore Nov 24, 2026 (Issuewire.com) - **HiBT** has launched its **CFD trading** service, bringing a wider range of traditional market instruments into its digital asset trading ecosystem. The newly available CFD framework gives eligible users access to price movements across foreign exchange, commodities, precious metals, energy products and global indices through a dedicated account structure.

CFD, short for **Contract for Difference**, allows users to trade the price movement of an underlying asset without directly holding that asset. For trading platforms serving global users, the format has become a useful bridge between crypto-native account systems and traditional financial markets such as **forex**, **precious metals**, **commodities**, **energy** and **global indices**.

For **HiBT**, the launch turns its earlier TradFi-style market access into a more defined CFD product line. The service now brings together USDT-based margin and settlement, bid-and-ask pricing, spread-based execution, position records, account bills and margin-risk monitoring inside one live trading framework.

Multi-asset access under a dedicated CFD framework

The live **HiBT CFD** service is built for users who follow more than one market. Currency pairs, gold, oil,

major stock indices and other traditional market instruments each carry their own quoting habits and trading sessions. A crypto pair and a global index do not behave the same way, and a currency cross is not priced like a precious metal.

That is where the CFD framework becomes useful. **HiBT** has structured the product around the mechanics of CFD trading rather than simply placing traditional assets beside crypto markets. Different quote currencies, trading hours, spreads, overnight financing and margin requirements are handled inside a unified account experience.

For users, the result is a clearer route into **global market exposure**. A trader watching currency volatility, gold movement, energy trends or index sentiment can manage those views from the CFD account without moving outside the broader HiBT platform environment.

Independent CFD account with USDT margin and settlement

A key part of the launch is the **independent CFD account**. Users transfer USDT into the CFD account before trading, and the account view shows figures such as equity, available margin, used margin, unrealized profit and loss, account balance and margin ratio.

This separation gives CFD trading cleaner boundaries. Activity in the CFD account can be viewed apart from other account areas, making it easier for users to read exposure, available funds and position pressure. For leveraged products, that kind of account visibility is part of the trading experience, not a back-office detail.

The **USDT-based margin and settlement** model also keeps results easier to follow. Different CFD instruments may be quoted in USD, EUR, JPY, HKD or other currencies, but the account framework converts relevant values back into USDT for margin and settlement. Users can therefore access markets priced in different currencies while reading account results through a familiar unit.

Bid-and-ask pricing brings CFD mechanics into the product

The service follows a **quote-driven CFD model**. Instead of treating the product as a copy of perpetual contracts, HiBT CFD uses buy and sell prices, with the spread reflected in the trading cost. That structure is closer to how traditional CFD products are normally presented.

Execution price, spread, position direction, financing cost and margin level all affect a CFD trade. By supporting bid-and-ask pricing, market orders, limit orders, take-profit and stop-loss settings, pending orders, open positions and historical records, **HiBT** gives users a trading flow that active market participants can understand quickly.

The product also makes the after-trade view more complete. Users can follow positions, review order history, check account bills and see how realized or unrealized profit and loss affects the CFD account. The structure matters because multi-asset trading becomes easier to manage when the record trail is not scattered across separate screens.

Risk controls are built into the live account experience

CFD trading brings opportunity, but it also requires visible controls. The HiBT CFD framework includes **margin ratio tracking**, risk alerts and forced-liquidation logic based on account-level margin conditions.

When an account approaches the platform's warning threshold, users can receive notifications through platform messages and related contact channels. If margin conditions reach the liquidation threshold, positions may be processed according to platform rules, with records available through CFD trading history.

The design keeps **risk controls** close to the user experience. Margin level, equity, used margin, available margin and unrealized P&L are part of the account view. For users trading across fast-moving traditional markets, those details make the CFD service easier to monitor and easier to understand.

A broader step in HiBT's multi-asset strategy

The CFD launch fits a larger shift in digital asset trading. Users are no longer looking only at crypto pairs. Many want one platform that can connect crypto trading, contracts, event-based products and traditional market instruments. CFD trading gives HiBT a stronger way to meet that demand.

With CFD now live, **HiBT** has added a more structured path for users who follow global macro markets, foreign exchange volatility, metals pricing, energy trends or index movement. The product keeps those markets inside a dedicated account and settlement structure, making traditional market exposure feel more native to the platform.

The broader message is clear: digital asset platforms are becoming more multi-asset, and the next stage of competition is not only about listing more products. It is about whether different products can feel coherent, traceable and operationally mature. HiBT's CFD launch is a direct step in that direction.

About HiBT

HiBT is a digital asset trading platform offering spot, contract, event contract, TradFi and multi-asset trading services for eligible users. The platform focuses on product clarity, trading accessibility, account security and risk-management infrastructure, while continuing to expand its global trading ecosystem.
