

Cutaneous T-cell Lymphoma (CTCL) - Market Insights, Epidemiology and Market Forecast 2027- Market In

Men account for over 53% of total cases of CTCL as compared to women.

Albany, Feb 13, 2019 (IssueWire.com) - [Cutaneous T-cell Lymphoma \(CTCL\) - Market Insights, Epidemiology and Market Forecast 2027- Market Insights, Epidemiology and Market Forecast-2027](#)

Men account for over 53% of the total cases of CTCL as compared to women.

- Cutaneous T-cell lymphomas (CTCL) are the most common types of skin lymphoma.
- More than 3 out of every 4 skin lymphomas diagnosed are CTCLs. They often appear as eczema-like skin rashes and can affect widespread parts of the body.
- There are different subtypes of CTCL. Most are slow growing but some can be fast growing. The most common types of CTCL are Mycosis Fungoides and Sezary Syndrome.

(Albany, US) DelveInsight launched a new report on [Cutaneous T-cell Lymphoma \(CTCL\) - Market Insights, Epidemiology and Market Forecast-2027](#)

Key Benefits

- This DelveInsight report will help to develop Business Strategies by understanding the trends shaping and driving the Cutaneous T-cell lymphoma (CTCL) market.
- Organize sales and marketing efforts by identifying the best opportunities for Cutaneous T-cell lymphoma (CTCL) market.
- To understand the future market competition in the Cutaneous T-cell lymphoma (CTCL) market.

[Request for sample pages](#)

“Market study carried out for the period of 2016-2027 shows that the Market Size of Cutaneous T-cell Lymphoma was about USD 698.47 Billion in 2016 in the 7MM, growing at an increasing CAGR during the forecasted period (2018-2027).”

As per DelveInsight estimates, men account for over 53% of total cases of CTCL, as compared to women. The total incident population of CTCL in the 7 major markets was approximately 8400 cases in 2016. DelveInsight estimates higher incident cases of CTCL in the United States with approximately 3,200 incident cases in 2016, followed by EU5 and Japan and also, there are approximately 1,700

cases of Mycosis fungoides in 2016 in the US. The incidence rate of Mycosis fungoides has been increasing significantly since the 1970s.

The treatment of CTCL depends on the disease stage. Early stage therapies are topical, including corticosteroids, retinoids, imiquimod (Aldara), ultraviolet A irradiation (PUVA), and total skin electron beam therapy. Systemic therapies are introduced in the advanced stages where the disease is widespread and/or resistant to topical treatment. These include interferon alpha injections, stem cell transplant, alemtuzumab (MabCampath) and other chemotherapy regimens. The United States had the highest market share of Cutaneous T-cell Lymphoma (CTCL) in 2016, followed by EU5 (Germany, France, Italy, Spain & UK) and Japan. The market size for the Early Stage First Line & Second Line Therapies of CTCL in the United States was found to be approx. USD 28.22 Million and USD 265.3 Million respectively in 2016.
