

## **Researchers concerned about America's childhood immunization schedule**

The New Zealand researchers and authors of a critically acclaimed book on vaccines have expressed concerns over America's official childhood immunization schedule.

# VACCINE SCIENCE REVISITED

Are Childhood Immunizations  
As Safe As Claimed?

JAMES & LANCE  
MORCAN

**Wellington, Mar 17, 2019 ([IssueWire.com](http://IssueWire.com))** - James and Lance Morcan, who co-authored the bestselling, new release book 'Vaccine Science Revisited: Are Childhood Immunizations As Safe As Claimed?', state their focus from the outset was on scientists' acknowledged and patented childhood vaccines, and to cover as many of these as possible they included the vaccines on the US Childhood Schedule of the Center for Disease Control and Prevention (CDC).

Speaking from Sydney, Australia, James Morcan says he and his co-writer considered the ramifications of the CDC's schedule in an early chapter titled 'Live/attenuated vaccines'.

"This schedule, as far as we can tell, includes more vaccines than any other country in the world," he says. "If the vaccine is on the schedule, it will blanket other childhood vaccines used across the world. The main difference will be the manufacturer of the vaccines."

Morcan says after looking at the various vaccines, it was noticed the vaccines are not all the same.

"Some contain dead germs, some contain living germs while others have no germs at all. We figured there had to be a good reason for the different types of vaccines so we decided to make that a part of our research, thinking it would be an essential component in the bigger picture."

This, he says, raised more concerns.

"Scientists are able to find a living germ to put into the vaccine by collecting it (the germ) from an individual infected by the wild version of it. A wild germ is a germ found out in nature. If it isn't wild, then it has been altered in the laboratory or is a descendant of a laboratory-altered germ. Since it's a weakened form of the wild germ, it is considered to mimic the natural disease the most out of all the vaccines. This is also why it's considered to have the longest and the strongest immune response of them all.

"The problem is, since it's a weakened, living germ, in order for it to work, it has to be able to replicate inside our body. At the same time, we don't want it to replicate too fast because our immune system needs to be able to handle the attack."

In their book, the Morcans stress that vaccine trials are performed on healthy individuals.

"Let's say they measure the safe rate of replication for a healthy child and then use that same vaccine on a child with a compromised immune system. What appears to happen at times, is that some children have such severely compromised immune systems that it causes the virus to replicate out of control.

"Vaccines that are manufactured this way are the rotavirus, measles-mumps-rubella (MMR), smallpox and chickenpox vaccines."

'Vaccine Science Revisited' is exclusive to Amazon. At the time of writing it was the number one bestseller in the Emergency Pediatrics and Immunology categories.
