

Eradani announces Version 2.1 of Eradani Connect Framework with Jira Support

Berkeley, Jul 23, 2019 ([IssueWire.com](http://www.IssueWire.com)) - Eradani Announces Jira plugin support for IBM i Change Management and Modernization with the release of Version 2.1 of Eradani Connect

- Easily view current development progress directly from within a Jira ticket including which IBM i programs are being changed and by whom
- Simplify audits by using Jira as the system of record for all activity against reported issues, including all IBM i DevOps activity
- Orchestrate multiplatform deployments from Jira

Eradani, Inc., (www.eradani.com) leading open source experts for IBM i, announced today the latest release of their Eradani Connect Framework for connecting the open source to IBM i native applications. Version 2.1 of Eradani Connect provides out of the box plugin support for connecting Jira Issue Tracking to Change Management from Rocket Software. Jira users are able to view, search and report on all IBM i change management activity related to a Jira ticket directly from within Jira. Auditors can now go to one place to see all change activity history. Operations users can have Jira orchestrate deployments across multiple platforms including the IBM i.

The new Jira plugin support is based on the Eradani Connect Framework. The Eradani Connect Framework allows open source developers to access IBM i native resources (programs, procedures, database, commands, etc.) using simple RESTful service calls. The Eradani Connect Framework translates those calls into IBM i program, command, procedure or database calls and then returns JSON to the service requester. According to Daniel Magid, CEO of Eradani, "It is our objective to make it so easy for open source developers to interact with the IBM i that they don't even need to know they are talking to an IBM i."

About Eradani: Eradani is owned and staffed by IBM i and open source experts with decades of experience in application modernization. The Eradani team delivered some of the first commercial Node.js, Angular and Cloud applications running natively on IBM i. Eradani provides services to help companies with their IBM i modernization efforts and Eradani trainers teach open source developers how to connect Python, Node.js, Java and other open source application languages to native IBM i applications.
