

Reekoh announces expanded integration product suite including automation and IoT Edge tools

Reekoh, the award-winning Australian data integration company, is expanding its product suite as it grows to reach more opportunities with global customers and partners.

Brisbane, Jul 28, 2019 ([IssueWire.com](http://www.IssueWire.com)) - At the 2019 Gartner Application Architecture, Development and Integration Summit in Sydney, Reekoh CEO and Co-founder Dale Rankine announced a new line up of data integration tools to build on their award-winning platform. The company is presenting for the first time at the renowned event for the integration industry and is building upon its credentials as a Gartner Cool Vendor and coverage in the Gartner Market Guide for IoT Integration.

"The past 18 months have been really exciting for us as we've been growing quickly in order to deliver innovation to our growing customer base," said Rankine.

"The team have been laser-focused on what will make the most difference to our customers as they come to terms with the challenges of making their data from IoT and physical assets matter to their organizations and stakeholders."

Rankine continued, "We're not interested in seemingly playing catch-up with larger incumbent integration players – we want to deliver products and services that truly enable enterprise customers who are now working within the Integrated Data Landscape; that is nexus of Physical (industrial and IoT), Application and Open data."

"This new product suite and branding is the beginning of an exciting new phase for us as we start to scale out globally and take our product innovation to customers and partners in some of the world's largest markets and industry segments. The next 12 months will be huge."

The Reekoh Integration Platform (IPaaS) has been branded Reekoh Fuse™ and has several updates being released including the new Data Schemas and Mapping module, and built-in Rules Engine.

New to the Reekoh product suite is Reekoh Bionic™ Automation Tools and Outpost™ IoT Edge.

The automation tools include IoT device simulators for hardware-less IoT solution development and the new Plugin Builder which will create new custom integrations in a matter of minutes. In an industry where the alternative regularly results in higher costs and longer time, these new tools promise to deliver considerable benefits to Reekoh's enterprise customers.

Reekoh Outpost™ IoT Edge solutions are bridging the gap between industrial and secure network "edge gateways" and the cloud. By running a Reekoh Outpost application on a gateway device inside buildings, factories, and other facilities, Reekoh is accelerating the connection and integration of data from the edge to enterprise customer's IT and application environments.

Reekoh is working with several global devices and secure network vendors to launch Reekoh Outpost™, including FreeWave, IoTium and Advantech.

This new product innovation, alongside the recent customer, wins across smart buildings and facilities, local government, utilities, and construction give Reekoh strong momentum to start the new financial year and to prepare for regional expansion.
