

The Future of Homes – Self-Sustaining Smart Modular Homes by Gaia Homes

Discover Gaia Homes' innovative approach to building net-zero energy homes

Sustainable. Modern. Smart.
Accessible. Modular.

San Francisco, Jul 22, 2019 (Issuewire.com) - For landowners who are looking to build their dream home, it is now possible to build the home of the future – smart-connected, energy-efficient, and eco-friendly modular home that costs a fraction of the traditional stick-built home.

Gaia Homes, a California-based modular construction company, has developed an innovative housing

product that incorporates sustainability, smart technology and accessibility features to offer a more sustainable living and better lifestyle to its homeowners. The modular company designs and builds ultra-sustainable modular homes in California through sustainable construction, materials, and processes. Utilizing solar energy and Tesla power wall technology, these homes become net-zero, which means they can generate as much electricity as they consume.

These homes are built in a factory. Unlike traditional homes that are built on-site, they are built in a climate-controlled environment to ensure efficiency and maximum quality. The houses only take 2-3 months to build and then they're delivered to the site in one day. This process saves homeowners a significant amount of time and money. From day one, they know the exact cost and schedule. This reduces a lot of stress-related to building a new home.

The founders of Gaia Homes are committed to environmental sustainability. Their goal is to make a positive impact on the environment through sustainable construction from smart design to smart choice of construction materials, process of construction, down to the maintenance of the homes over the course of their lifetime. The company claims that its construction method can reduce construction waste by 50% and improve the quality of living of its residents.

Vanessa Liu, Co-founder and Director of Design – Gaia Homes

"Gaia Homes is born out of necessity; we the co-founders believed that these net-zero modular smart homes will transform the building industry toward a healthier tomorrow. For centuries, our homes have been relying on electricity generated at utility-scale electricity generation facilities. We burn fossil fuels to power our buildings. As a society, we've realized that there has to be a better way. We need to focus on renewable sources, such as the sun," said Vanessa, Director of Design of Gaia Homes. "I envision Gaia Homes to be the ultimate answer to the housing and energy crisis of our age. If an electric car company like Tesla can revolutionize the transportation industry, there has to be a home construction company that does the same. This is what Gaia Homes is created for."
