

## iProfit MT4 EA completes six years in real trading

**Hyderabad, Aug 21, 2019 ([Issuewire.com](http://Issuewire.com))** - iProfit MT4 EA completes six years in real trading

iProfit is a Neural Network based trading strategy which has been developed by Phibase Technologies – A software firm specializing in Forex trading research and development. Phibase has been in the field of trading strategy development since 2011.

The Forex market is the largest in terms of trading volume and offers maximum liquidity. It is easy to enter and exit a position in any of the major currencies within a fraction of a second for a small spread in most market conditions. Financial Institutions and large banks are the major players. They have access to excellent infrastructure, knowledge, real-time information and data to be successful in trading. Retail traders who enter Forex start off with a disadvantage and need to work really hard on every aspect to see profits. Most get lured into Forex trading with unrealistic expectations only to end up losing it all.

It is very rare for a fully automated software to continue performing well for so many years without any hype. iProfit is not the regular “run-of-the-mill” EA and promises to be a great tool for serious investors and traders.

### History :

The strategy has been developed by Phibase Technologies – A software firm specializing in Forex trading research and development. Phibase has been in the field of strategy development since 2011

and their product line includes several automated strategies like Cabex, Raybot, Index, and iProfit.

Phibase Team is very professional in its developmental approach and has been around to provide high-quality support.

### **What is iProfit Neural Network Trading Strategy?**

High Frequency Trading (HFT) strategies are used by large investment banks, hedge funds and institutional investors who have access to powerful computers which can make a large number of transactions at high speeds and low cost. They typically make a very small gain or loss on each trade – the goal is to make a net profit for the day after accounting for all costs involved. Large investment firms may use proprietary algorithms which are usually closely guarded secrets or even some simple strategies like moving average cross overs. Such firms employ many different strategies simultaneously – some of which generate a large number of trades and while other strategies may not trade that frequently, but my aim for larger gains.

It is impractical and unprofitable for retail traders to consider the use of such HFT strategies since the spreads, cost of trading and execution slippage/speed are enough to guarantee loss over a period of time.

So what does iProfit HFT for retail trader mean? While HFT strategies function on price data in second or minute time-frames, iProfit EA is based on price from hourly time-frame. Basically, the concept appears to be the same – make a large number of trades for small gain-loss and take a net profit at the end of trading. iProfit HFT trades about 15 to 20 times per week and tries to make a net profit by end of the week. All trades are closed before the market close on Friday. Read the [full review of iProfit MT4 EA](#)

The neural network model is a simple model which is designed to just predict the High and Low of the next hour. The EA uses this prediction to make its trade entry and exit. iProfit is powered by a self-contained, self-learning Neural Network (NN) algorithm. The strategy does not try to outsmart the markets but aims to keep generating small gains while keeping losses low – This is indeed the principle of HFT.

iProfit HFT EA website provides complete strategy details, tests results and a significant amount of information (<http://iprofitea.com>). iProfit HFT EA has been in live trading since August 2013. The trading strategy has survived several different market cycles on a variety of pairs and has made decent gains in the process.

iProfit is most suitable for traders who want to have a safe, proven frequent trading strategy in their portfolio. The EA will deliver small gains on a weekly or monthly basis which quietly add up to grow your account in the background. This is how large investment firms use HFT to make small gains on a segment of their portfolio.

iProfit HFT EA is not for traders looking for “Forex Robots” that promises to “double money every month”. It would also not be suitable for traders with account sizes less than \$3000 since the gains will not justify the cost of the EA.

If your Forex trading account size is over \$5000 and your broker provides leverage of 1:50 or above – then this is a great way to get started with this retailer version of High-Frequency Trading.
