

Blockchain Development Company In India

Bitdeal a reputed blockchain development company in india, explores about its blockchain services and solutions.

Madurai, Oct 31, 2019 (Issuewire.com) - Bitdeal a leading and monopoly blockchain development company, covering 100+ international countries Including the US, UK, Canada, Brazil, Australia, Korea, Singapore, and Japan to serve the potential clients who are enthusiastic about implementing blockchain technology for their real-life use cases. We have gained our brand reputation through implementing the blockchain as a service (BaaS) for businesses to improve their quality as well as quantity of

business operations.

We started to strive into this industry from 2015 with just limited goals, and Initially, we started to serve **BaaS** for only limited countries (i.e) nearly **30-40 countries**. But, the unexpected growth of people grace in blockchain implementation, have inspired us to expand our services to serve **100+ countries around the world**.

Our expertise in Familiar Blockchain Networks

We often keep a keen eye on the ever grooming blockchain industry, Our team of tech intelligence has witnessed there are **10+ blockchain networks** have emerged. Hence we started to implement and start serving hot to our clients by doing proper R&D. Currently, we are under beta development of developing blockchain applications, tokens and smart contracts in Tezos Blockchain.

- **Ethereum**
- **Hyperledger**
- **TRON**
- **EOS**
- **IPFS**
- **Minter**
- **Multichain**
- **Corda**
- **R3**
- **Cosmos**
- **Open Chain**
- **Quorum**
- **Stellar**

We are Experts In Private Blockchain Development

Private blockchain is advanced to the public blockchain concept. Here the authority of read/write and moderating access has been issued to a single entity or a group of people. As there exists a central authority in private blockchain, it breaks the prime nature of public blockchain "Decentralization". Hence this kind of ledger technology will be known as distributed data ledger interoperates with cryptography functionalities.

As the private blockchain breaks the concept of "Decentralization" It breaks the common difficulties that we used to face while applying the blockchain concept for private usage.

1. No one has the right to read/ write/ edit a transaction or a consensus unless he/she has the permission to do it. Hence this type of blockchain is known as Permissioned blockchain.
2. The time is taken to verify a single transaction will take less time, as it eliminates the multiple verifications from multiple nodes.
3. Fully Secured. Only if we don't allow third parties to access the network.

We Bitdeal- a **reputed blockchain development company**, who are the monopoly and the one who initiated to provide blockchain services for the first time in South Asia. We are having a troop of expert blockchain developers, who are familiar with custom blockchain application development for different types of industry verticals.
