

AFS Foundation and Waterproofing Specialists Highlights Mistakes To Avoid While Waterproofing Crawl Space

Huntsville, Mar 27, 2020 (Issuewire.com) - When it comes to crawling space waterproofing, valuable advice comes from *AFS Foundation and Waterproofing specialists* who are the noted crawl space contractors in Alabama.

A crawl space is one of the essential places in one's residential property. How it is maintained tells a lot about how it is going to affect the foundation. Keeping the crawl space dry and clean is crucial, and that is where one needs the help of crawl space contractors in Alabama. AFS Foundation and Waterproofing are known for their exclusive service. They address crawl space issues and can offer the best crawl space waterproofing solutions. The crawl space contractors can also help with pointing out the common mistakes that one needs to avoid while handling crawl space waterproofing.

The first thing that they point out is not to add additional vents in the crawl space. Additional vents do not pull out moisture from the crawl space. Instead, the additional vents will only pull in more humid air. It is better not to add additional vents in the crawl space while waterproofing the same.

Then they point out that it is better not to add vapor barriers to the floor joists. [Crawl space waterproofing contractors in Alabama](#) should avoid installing vapor barriers to floor joists for keeping the moisture from seeping into the wood joists. Condensation can get trapped in the crawl space just between the joists and the vapor barrier when it becomes hotter.

The crawl space contractors in Alabama also advise on not using fiberglass while insulating the crawl

space. Fiberglass pulls in more moisture, which can lead to mold growth in the crawl space. The experts are also of the opinion that one should not be using spray foam in a damp crawl space.

As the last thing, the expert crawl space contractors ask not to overlook the drainage system. Keeping the crawl space clean and dry is necessary so that no moisture can grow there. It is better to install a sump pump that can help eliminate any incoming water and humidity.

The crawl space contractors at AFS Foundation and Waterproofing ensure that these mistakes do not take place. The crawl space is a significant part of the entire structure of the house. AFS Foundation identifies all crawl space issues and gets them resolved at the earliest.
