

ACP collaborates with AWS to protect the UK's manufacturing industry at a time of clear and present danger

AWS cloud infrastructure powers ACP's Remote Cyber Protection™ - a security solution to protect manufacturers in the 'new normal'.

London, Jun 8, 2020 ([IssueWire.com](https://www.issuewire.com)) - To meet the clear and present danger to manufacturers posed by the recent cyber pandemic, Assured Cyber Protection (ACP) – a firm that provides bespoke cybersecurity solutions that delivers cyber immunity – built Remote Cyber Protection™, a multi-functional technology solution to protect remote workers from cyber attack. ACP recognised early on that as COVID-19 spread biological devastation across the globe, it also unleashed a new wave of assaults on UK companies that were overly reliant on their on-premise protections to defend their databases and assets from exposure through their remote workforce.

Responding directly to this urgent need for new security solutions, ACP Remote Cyber Protection delivers robust endpoint protection together with anti-ransomware and anti-phishing defences while continuously monitoring threats that can be managed locally via a single-pane dashboard. This rapid-response technology solution was specially engineered to defend against ransomware and email phishing attacks which, according to one source, increased by 400% during the coronavirus outbreak.

To help manufacturers immediately and affordably protect themselves and their remote workers from cyber infections, ACP simultaneously introduced a 'protect now, pay later' 6-month delayed payment plan to prevent organisations from being compromised by this new wave of attacks.

ACP Chief Executive Mitch Scherr said, "We are proud to offer this special plan to the UK's manufacturers during these difficult times. Our 'protect now, pay later' offer relieves some of the financial pressures while providing peace of mind that a company's most valuable asset, its business, is fully protected."

Recognising the need for a strong cloud infrastructure for ACP Remote Cyber Protection, ACP chose AWS to host the solution. ACP used AWS technology to ensure the infrastructure was resilient and stable, would deliver cost-effective solutions in the long term, and would get ACP Remote Cyber Protection to market quickly.

During these uncertain times, ACP is helping protect critical elements of the UK's infrastructure from cyber attack. As remote working becomes the '[new normal](#),' the need for bespoke solutions like ACP Remote Cyber Protection will continue to be at the forefront of building immunity against evolving cyber threats.
