

Scissorsafe USA Innovative Fall Protection System - Scissorsafe USA Safety Equipment

Dallas, Aug 9, 2020 (Issuewire.com) - The Scissorsafe shackle anchor design delivers added safety to workers by allowing companies to install more anchor points easier, quicker, and more economically, staying in place even after the structure is completed. The concrete anchor tool delivers safety during construction and after the structure is built. Molds are placed everywhere within the building perimeter, and also in elevator shafts, staircases, and other fall risk areas.

ScissorSafe is an anchorage point for personal fall protection providing a connection point for your lanyard, self-retractable lifeline, or horizontal lifeline in case of a fall.

SIMPLE AND FAST INSTALL

The recycled plastic mold-bottle is environmentally friendly. The mold-bottle cap is nailed to the formwork's inside-face and then the mold-bottle is snapped onto the cap. This takes place just before the concrete is poured. Once the concrete cures and the formwork is removed, the nailed cap is removed exposing the opening of the mold-bottle. The anchor can then be inserted into the hole and locked into place with a carabiner. Anchor points are recommended every 15 feet or between pillars to maximize coverage where falls can occur.

The exposed hole with the anchor inserted provides an immediate fall protection system, eliminating valuable time spent installing a non-embedded system. This cuts down task time allowing more work to be done, plus workers can easily move from one work area to another by quickly relocating the anchor. The Scissorsafe anchorage tool's design resembles a scissor with two blades that move. It is inserted into the mold-bottle that is encased in the concrete. The ends of the tool anchor inside the mold-bottle when the eyes of the tool are aligned. A 10mm carabiner is inserted into the eye and locks the tool in place.
