

All About Online Courses and Education Platform Like Loort.biz

Warsaw, Dec 1, 2020 ([issuewire.com](https://www.issuewire.com)) - For the last decade, the market for e-learning and online course is increased dramatically. With the new requirements to social distancing, this industry is experiencing huge growth and estimated to be worth \$325 billion by 2025.

Online education becomes possible due to the quick development of online education platforms. Online course platforms are special software where teachers share knowledge and experience through video, image, text, audio, and PDF files. Online course platforms are often called a learning management system (LMS), which is a fancy word for software that helps users create, administer, manage, and analyze eLearning courses and trainings. The Learning Management System (LMS) and Virtual Learning Environment (VLE) have become increasingly common in education nowadays. They can be used by school teachers, lecturers, and even somebody who just want to give a masterclass on cookies making.

The best Online courses education platform are:

- Google Classroom
- Docebo
- WizIQ
- Adobe Captivate
- Elucidat
- Articulate
- Shift
- Blackboard Learn

Online education has as many advantages as disadvantages. Firstly, let`s talk about the advantages. Working with an online education platform you can plan effective courses with one click. You can welcome large groups, small groups, or individuals within a virtual classroom. The platform gives the opportunity to work with individual students or with groups of students. Your students won`t have to install any software to their own computer, because educational platforms are generally cloud-based software. You can create customizable progress reports. Your students can access interactive content through their smartphone or tablet. You do not need spent time on assessment parth, you can create automatic assessments at the touch of a button.

But, on the other hand, the most serious problem of online courses is data security. As with all software, security is an important problem in distance education platforms. Especially e-learning platforms that offer official certificates, can be attacked by malicious people. Because of this, the system must be open-source and periodical maintenance, updating, backup, and hosting. Recently, few famous educational platforms lost users` data. Regarding advanced technologies linked to the platform economy, such as blockchain and artificial intelligence (AI), the education sector among others is likely to be affected. For example, the European Commission`s Joint Research Centre (JRC) recently published a study on blockchain in education, and the report describes promising opportunities to involve blockchain technologies in student information systems and granting or verifying certificates, etc. Visit <https://loort.biz> and join any courses from the world-class instructors and be an expert to change the world!
