

Licence Partners for the original IRI® PEN

We are looking for license partners who want to profit from our revolutionary Invention

New York, New York City, Feb 18, 2021 ([Issuewire.com](https://www.issuewire.com)) - The problem of dissatisfaction with the shape or fullness of the lips is internationally known, which is why lip injections are one of the most common beauty procedures in the world. Titled as relatively fast, simple, and with usually immediately visible results, this is hardly surprising. However, conventional methods (such as using a cannula and hyaluron) are a double-edged sword. Here, the results are anything but entirely satisfactory and the patient must be prepared for side effects and pain. Furthermore, the uncomfortable feeling of the needle remains...

But now there is a revolutionary solution to this problem, and it is called the IRI® Pen. The pen-like device, which already won the German Innovation Award in 2020, shoots the hyaluronic acid from a capsule onto the skin. Not only does this eliminate the need for a needle, but it also delivers results that are many times more reliable and has provided consistently excellent customer satisfaction since its initial launch in 2018.

However, these are by no means all the advantages that the IRI® Pen has to offer compared to conventional technologies. Treatment is virtually painless and requires little effort, which, coupled with its ease of use and high cost-effectiveness, makes it ideal for beauty salons and physicians. In short, the IRI® Pen offers everything needed for fast, efficient, and problem-free work. Not only we at YAVU (inventor, developer, and designer of the IRI® Pen) have noticed this, but also the numerous studies and certificates that the IRI® Pen has already successfully passed. Particularly appreciated was the integrated ratchet, which once again sets the IRI® Pen apart from the numerous counterfeits existing on the market. It not only makes it possible to precisely adjust the amount of hyaluron to be injected but also prevents the injection from penetrating deeper than the upper layers of the skin. This makes the IRI® Pen as precise as it is safe against errors and incidents.

A few days ago, our patent application in the USA was successful, which is why we are now looking for licensees for the American market who recognize the gigantic potential of this protected innovation and can also profit from it. So if we could inspire you, we are looking forward to any kind of contact. So don't hesitate and be the first!
