

See why Diamond Veneer puts to shame the Common Cubic Zirconia for it's genuine Diamond look!

Cubic Zirconia is so cache

California, Los Angeles, Feb 11, 2021 ([Issuewire.com](http://www.Issuewire.com)) - Taken to a whole new level, Los Angeles based Diamond Veneer Travel Jewelry Company has nailed the concept of coating, Carbon Diamonds onto [Cubic Zirconia](#) to practical use. Diamond Veneer is set to revolutionize the way we look at CZ's and will certainly render them obsolete. It is fast spreading, the fact that Diamond Veneer will soon become the iconic term used to define this new, innovative process in the jewelry niche, as "Kleenex" is for napkins, and "Frigidaire" is for refrigerators. Diamond Veneer Coating Process utilizes an Eco-friendly Green process without using Radiation or harsh chemicals.

In an interview with Jacob Hassidim the founder of Diamond Veneer he had this to say "I believe this concept will revolutionize the jewelry industry, and in time will render the Cubic Zirconia obsolete". Speaking further he stated, "The main advantage of this concept is the fact that DIAMOND VENEER blurred the main differences between real Diamonds and the CZ, to the point of absolutely no recognition". Well, that was not all from him, he went further, saying "The fact that the CZ is no longer white, now; even the professional jewelers lost their expert eye advantage thereby recognizing DIAMOND VENEER as fakes!"

If you have always stayed away from wearing or purchasing CZ because it is so obviously not a real Diamond, you'll be pleasantly surprised with the new Diamond Veneer. Every woman deserves head-

turning jewelry including diamonds, which are still a girl's best friend! While sparkle and shine are the goals, diamonds aren't always in the budget—but now they don't have to be. Most women shay away from wearing Cubic Zirconia Jewelry, given that it usually looks fake and carries that stigma. Cubic Zirconia has a reputation of looking very white. Diamond Veneer has changed the way people look at CZ by treating it with a veneer of carbon diamond particles, crystallizing around the entire stone, which results in a flawless "G" color on the diamond color scale. This vaporization process under extreme heat and pressure conditions significantly increases (4-5 times) the fire, refraction, and durability of the CZ as a real Diamond at CZ price!
