

DR FRANK HARON MILO Speaks on the Benefit of Covid-19 Vaccine,

Covid-19 Vaccine

Illinois, Chicago, May 12, 2021 ([IssueWire.com](https://www.issuewire.com)) - The ongoing pandemic has had the devastation of tremendous magnitude claiming millions of life in just one year. Fortunately, scientists and researchers have been able to create multiple numbers of vaccines against the virus in a very short time, working tirelessly. St. Vincent Memorial Hospital in Illinois is also doing its part to ward off the disease by availing the Covid-19 vaccines to the public. The hospital is working towards the goal of a Covid-19 free USA, providing the safest and most effective Covid-19 vaccine to everyone. The highly qualified 84 doctors and the 300 medical staff at the hospital offer the best service when it comes to vaccination. People can get back their pre-pandemic life and start doing things they couldn't do now by getting fully vaccinated.

There have been many speculations going around the country about vaccines. A lot of people think that it is not safe to get vaccinated. The hospital prioritizes the safety of the patients before anything. Many vaccines are being developed all around the world. But they only use the vaccines that have gone through the routine processes and procedures correctly and have been authorized by the CDC. The vaccines given at the hospital have zero possibility of making the receiver sick with Covid-19. None of the authorized vaccines in the United States has living Coronavirus. So, they cannot infect anyone with Covi-19. There are certain side effects like fever, nausea, fatigue, and a few more. But these side effects come with any kind of vaccine and not just the Covid-19 vaccine. These symptoms are a sign that the body is learning to fight the virus and building protection against it. The body builds immunity against the virus in a few weeks. People need to keep themselves protected after the vaccination or they can still contract the virus before the body is fully immune. St. Vincent Memorial Hospital guides the patients through the whole process, offering them the right advice, making sure the vaccine is fully effective.

Vaccination is the most necessary thing for everyone. It is a must even for the people who have already contracted the virus and recovered from it. There are thousands of cases all over the world of people getting re-infected after their recovery. The experts are still not sure how long the protection lasts after recovering from the Covid-19. Vaccination is the safest way to build longer-lasting protection against infection. People can consult the highly qualified doctors at St. Vincent Memorial Hospital with their queries before they get vaccinated. They are always eager to inform people about how the Covid-19 vaccines work and bust the myths going around about the vaccines. Many are concerned that the vaccine may alter their DNA. The doctors at the hospitals assure that the vaccine does not change or interact with Human DNA in any way. The Moderna and the Pfizer-BioNTech vaccines are mRNA vaccines. They teach the cells in a body to create a protein that escalates its immune response. The DNA stays in the nucleus and the vaccine never enters it. So, there is absolutely no chance of the DNA coming in contact with it.

There are two ways the Covid-19 virus is affecting humanity. In some cases, the infected person gets ill from mild to severe. They have to take medicine or hospitalized. Some recover while some succumb to death. In the other case, the infected person is asymptomatic. It means that they do not get affected by the virus and experience no symptoms of the disease. They are the most dangerous type because they do not get tested and unaware that they are carrying the virus and infect people wherever they go. That is why a mass vaccination is extremely necessary. The vaccination breaks the chain of infection, eliminating the plague from the roots. The vaccines have gone through several clinical trials and have been tested on humans to make sure that they are safe and effective for the mass. The benefits of the vaccination are far greater than the potential risks.

The best part of the Covid-19 vaccine is that it is not something chemically produced substance that can have severe after-effects in humans. It naturally triggers the immune response to the foreign virus in the body. It is the most natural way possible to build protection against the disease. The longer the people stay unprotected, the greater the chances of the virus getting stronger. It has already muted several

times and produced more destructive strains all over the world. Vaccination can also reduce the chances of these mutations by lowering the chances of infection. It can save millions of life effectively. Dr. Frank Heron Milo, a St. Vincent Memorial Hospital is keeping people up to date with the latest information about the vaccine and the virus through the hospital's official website.

Wearing masks, maintaining social distancing, and using instant and frequent sanitization can lower the chances of infection but do not provide foolproof protection against it. A fully vaccinated person would not need these if they are in a room with other fully vaccinated people. So everyone gets the full doses of vaccines, then hopefully, one day everyone will not be needing masks at all while indoor or outside. While the Pfizer or Moderna vaccines require 2 doses to be fully vaccinated, the Johnson & Johnson's Janssen vaccine requires only a single dose. St Vincent Memorial Hospital is offering the Pfizer-BioTech, Jonhson & Johnson, and Moderna vaccines to its patients.

St. Vincent Memorial Hospital is a reputed hospital in Northbrook, Illinois. Being in existence for 72 years, it has serviced thousands of patients providing the best care and medical solution in the area. The hospital has an available stock of vaccines from Pfizer-BioTech, Jonhson & Johnson, and Moderna. People can easily book an appointment and get vaccinated. To know more about their vaccination process in detail and book an appointment, visit their website at <https://www.stvincentmemorialhospital.com/>.
