

Get the High-Quality Laser Hair Treatment in CA

Menlo Park, CA, 8 April 2021

California, Menlo Park, Apr 12, 2021 ([Issuewire.com](https://www.issuewire.com)) - Laser hair removal is a cosmetic procedure to permanently remove unwanted hair. To get smooth and hairless skin is the desire of every woman. If you get tired of painful waxing, plucking, or shaving to remove your unwanted hair, [laser hair removal treatment](#) in CA may be the best option for you.

It uses a concentrated beam of light/Laser to remove unwanted hairs. This laser emits light that is absorbed by the pigment in the hair. The light energy is converted into heat that damages the hair follicles. By contrast shaving, waxing doesn't target hair-producing follicles. This method removes hairs only above the surface.

The laser treatment works best with light skin tones or darker hair colors. Because the laser targets hair melanin and the pigment contrast make it easy for the laser to target the hair, and destroy the hair follicle. Even if some hairs are not removed, the lightening of their color reduces the appearance of hair on the skin. Visit [Foreviva Medical Clinique](#) today to get flawless hair-free skin. The skin-care experts are always ready to assist in regaining beauty and anti-aging solutions to you anytime.

What to Expect at Foreviva During Your Laser Hair Removal Treatment?

Before starting the procedure, the skin-care professionals cut some hairs (to a few millimeters) above your skin surface. Numbing medicine is applied 20-30 minutes before the procedure.

Depending on the type of laser or light source used, you need to wear eye protection. A special cooling device or cooling gel is applied to protect the skin and this will also help the laser light penetrate the skin.

The technician will give a pulse of light to the treatment area. This will pass through your skin to hair follicles and damage the hair follicles. You may feel discomfort because of intense heat from the laser but the cooling gel will give you a cold sensation.

When the procedure is completed, you may be given anti-inflammatory creams or gels to ease any discomfort. Minor side effects are common like changes in the color of skin, skin redness, and blistering on the skin. They are temporary so you need to follow the specific instructions before and after the treatment. These might include:

- Avoid sun exposure and sunbathing before and after treatment.
- The heat from the laser stays in your skin for almost 24 hours so avoid the gym or hot showers after the procedure. As warm weather can increase the risk of bacteria.
- Avoid pain-relieving creams and scrubs 2-3 days before and after treatment.
- Waxing and plucking are strictly prohibited before the process. Trimming and shaving are recommended instead. To get more information, you can visit for [laser hair removal near you](#) to get the most effective results.

Benefits of CA Laser Hair Treatment

Here are the benefits of Laser hair treatment you will receive from experts specialized in Medical aesthetics, Menlo Park:

• Safe and Advanced Technology

We use advanced technology and different types of laser for different skin types and color complexion. It gives you safe and cost-effective hair reduction.

• Less Painful than Other Hair Removal Methods

Laser hair removal is a less painful alternative than wax treatment. By using the cooling gel, you will not feel much heat sensation.

• Can Remove Hairs from Any Part of Body

Except for eyelashes, laser hair removal can be used to remove hair from any part of the body.

• Long-Lasting Results

Laser hair treatments directly target the hair follicles through the laser, damage or destroy the hair follicles. It inhibits the hairs' ability to grow. You will get hair-free skin for a long time with our laser treatment.

How Long Does Laser Hair Treatment Last?

Hair removal treatment in our Menlo Park clinic takes weeks to get rid of unwanted hairs. But you will see the results on the first visit. After every visit, you will notice fewer and fewer hairs are growing back. Hair removal is permanent if the hair follicle is destroyed. But if it is only damaged, the hair will regrow.

It is difficult to destroy every hair follicle. But you will get the highest degree of permanent hair reduction. Most people can expect some hair regrowth within a few months. When hair regrows, it is lighter and less noticeable than it was before the laser treatment.

To perform laser treatment, experienced dermatologists need proper training. If done by an untrained technician, it could leave burns and scars on the skin. [Dr. Joelle Osias](#) is well trained and experienced to process safe hair removing treatment and provide the highest level of satisfaction. Contact us today for unwanted hair removal or other skin-care solutions like micro-needling, PCOS, cosmetic injectables, IV therapy, or others.
