

# Say Goodbye to Tech Hegemony and Hello to Democratized Instant Messenger — Wiremin

This encryption app is based on devices for networking without relying on giant tech corps' cloud services, thus eliminating censorship and de-platforming.

**California, Los Angeles, Apr 21, 2021 ([IssueWire.com](http://IssueWire.com))** - Making communication easy for everyone has been the call from many activists, cybersecurity nerds, and privacy beholders. This includes not just end-to-end encryption and free from government overreach but also from the overreach of the tech giant themselves. With billionaire moguls and corporations running the mega show, their unlimited access to people's data without any oversight means people's data is always at risk. The oft data breaches the past few years have proven that amply. But is there a service that eliminates this problem entirely?

Say Hello to WireMin. They are the only democratized instant messenger service out there that values privacy to the fullest extent. They also value users' right to speak their minds without the fear of being de-platformed, censored, or banned. Operating away from servers owned by tech giants, WireMin works purely from people's own devices. It's not just another bare-bones messaging app. It's a fully-featured, encrypted and fully decentralized app that completely eliminates the possibility of any censorship or data breach.

In order to plug the gaps, which are really giant holes made by tech corporations, WireMin was founded to counter this overreach. On a planet where privacy is increasingly becoming a joke, the WireMin team has rolled out an absolutely private messaging app that doesn't have data centres, doesn't collect user data, doesn't re-route messages, and doesn't authenticate their users. Believing in equal rights for all, they have designed a peer-to-peer network that's not cloud-based and hence, no one has the "privilege" to control the user's thoughts and minds. Not the Big Tech, and not the WireMin team themselves, even for business purposes. Apart from the user, not another soul holds the key to revealing data. WireMin's decentralized robustness and continuous upgrades to better privacy makes it an unstoppable social network. Users won't be tracked, won't be hacked, and won't be breached. It's an ironclad commitment coming straight from the Founder of WireMin, Baron Swartz.

## About

WireMin is a private and secure instant messaging service that is the safest social network currently. While providing a decentralized, cloudless network, it bets high on unbroken encryption and data access, including from its own employees — quite unlike certain other popular networks.
