Privacy.Page – Letting People Protect their Confidential Data on the Internet

California, Los Angeles, Jun 14, 2021 (Issuewire.com) - Cybersecurity initiative, Privacy.Page is a company based out of Israel that aims at raising awareness about the importance of privacy, and data security.

Over the years, the increase in the number of cybercrimes, information leaks, ransomware, and data breach from various personal accounts on Instagram, Facebook, Google, Telegram, PayPal, and more are constantly on the rise. As a result of this worldwide increase in data security issues, people are worried about the safety of private information and the potential abuse that could manifest as fraud, identity theft, voyeurism, and other criminal acts. Since the early stages of the pandemic, the whole world has turned towards the digital world for all of its professional and personal goals. As a result, data breaches and information theft have also increased significantly over the past year.

The significant rise in cybercrime is one of the reasons why Privacy.Page came into being. Led by the visionary Dr. Lev Topor, their initiative forms the ground for awareness and safety. The lack of protection by the law and the lack of action of the government in this regard is insufficient in removing leaked data from secret platforms such as the Dark Web. Hence, the common man is his own savior as they have realized that data security measures must be taken by themselves rather than wait for an agency to reach out, and that too with no substantial backup.

Leaked information cannot be leaked by police agencies or the common internet user especially when the action is against something like Dark Web. Privacy.Page is offering some of the most affordable services leading people to know the exact information that was leaked. Even though some information continues to reside on the Internet, the company will help with various preventive measures such as changing a password, canceling a credit card, reporting to authorities about IDs or Passports that were maliciously scanned and leaked.

Privacy.Page has access to over a trillion accounts from all over the world. They can trace passwords, social media accounts, SSNs, IDs, passwords and emails, phone numbers, personal information that was leaked using the method of doxing, industrial leaks, and even secure accounts like Telegram accounts.

Privacy.Page is a data security company that is aiming at making data leaks obsolete. By allowing people to know more about online information leaks, they are paving the way for a more secure and safe future for all. Visit their website https://privacy.page/ for more information.
