

Techademy launches smart interactive video player to enhance in-video engagement for eLearning

Karnataka, Bengaluru, Sep 22, 2021 ([Issuewire.com](https://www.issuewire.com)) - Online learning has now replaced interactive physical learning experiences. One of the most significant disadvantages of eLearning is that it is mostly passive, with little or no interaction with the learner and no peer collaboration.

[Techademy](https://www.techademy.com) foresaw the problem early on and has implemented remedies and interventions through its integrated Learning Experienced Platform, which strives to address it.

Presently, with the recently launched smart interactive player, Techademy facilitates enterprises and educational institutes to create highly personalized, collaborative, and on-demand video material for

their learners, resulting in increased learner participation and improved learning results.

Learners can use the new interactive player for guided viewing, video assignments, and collaborative learning. It can also assist organizations and institutions in tracking deeper insights about learner engagement, interaction, content consumption, rate of comprehension, and other factors at the course, audio/video, and even individual level. This enables tailored learning interventions as well as precise measurement of outcomes.

"The new player update is in line with our objective to improve learning experiences and make online learning comparable to, if not superior to, in-person learning. We are assisting enterprises in leveraging technology to create extremely successful learning programs that are personalized to each student, thanks to these collaborative features and advanced metrics," adds Keshava Raju While commenting on the latest launch of Techademy interactive video player.
