

U.S. Based VLink Modernizes E-Learning Platform into a State-of-Art Solution Serving Customers in 100+ Countries

Framingham, Massachusetts Sep 13, 2022 ([Issuewire.com](https://www.issuewire.com)) - Modernizing IT legacy systems can improve your business performance, streamline processes, and create new ways to serve customers. Many systems today are built on decades-old technology and need digital transformation. VLink's digital enhancements solutions help organizations update legacy code, adopt modern technologies, and migrate to Cloud-Native applications. Allowing them to tackle transformation initiatives.

One of VLink's clients is a leading U.S.-based school management software leader. They've catered globally to private, public, international, religious, and independent schools for over 35 years. The client approached us for the enhancement of their cloud-based SIS solution, which school districts and other educational organizations across the globe utilize. Schools in 100+ countries use the system to manage administrative tasks, enhance communication, and much more.

The brand reinforces its experiences with customers across the education industry. During these times of global pandemic, they are placing the highest priority on existing solutions & mainframe

modernization.

Integrating legacy applications with relevant technologies, such as cloud, analytics, and mobility can inhibit digital transformation efforts. VLink's **digital transformation** solutions help organizations update legacy code, and adopt modern technologies, and Cloud-Native applications to overcome these barriers.

Nitin Nijhawan, Chief Digital Officer for VLink says, “the successful partnership we have with the client is fantastic and running well as we leverage technology in an optimized way to better serve their educational clients across the globe.”

“With our solution, they could re-architect legacy applications to leverage the cloud-native stack. It is a platform for building and deploying applications that enable developers to deliver industry-critical tools and services quickly. “

VLink decided to divide the task into sustainable steps for easy and quick accomplishment of the same.

The principal focus was on how the team could obtain the necessary expectations for the client. Technical skills were essential in digitizing some of these systems and helping to improve their products so that customers could access an improved, quicker, more agile product.

Nijhawan highlights that a team was formed to handle fast-paced development, providing a reacting node with experts in eight months so that they can launch features by November. Our quick response time, ability to adapt to client needs, and fast turnaround time resulted in growth for the company.

VLink assisted them by providing vital resources (IT Project Staffing) to fill the gaps that they were experiencing.

VLink's value proposition in the legacy system modernization space was driven by providing a dedicated engagement manager/account manager who worked very closely (in conjunction with) the customer to understand their pain points. VLink was able to offer them proactive support in real-time in the U.S. with the offshore team (less costly resources) to address their issues.

Although the project is scheduled to take eight months, VLink will work if necessary to meet the client's needs and expectations and to ensure the enhancements and products are delivered to meet the client's needs.

Using the right tools, team, and experience!

VLink combines industry experience with highly specialized technical skills in our modernization methodologies and technologies. VLink provides turnkey transformation services that align with your current and future business requirements while reducing risk and costs.
