- STEWARDING
- FLOOR MAINTENANCE
- DISINFECTING SERVICES

Singapore, Singapore Dec 20, 2021 ([Issuewire.com](https://www.issuewire.com)) - Day&Night Services, an industrial cleaning services Singapore-based company, shares some of the best practices every cleaning company needs to follow to create an optimal working environment.

With hundreds of workers and machinery operating in factories and other manufacturing facilities, safety should be the number one priority. A simple mistake can often lead to dangerous situations that'll put the health and well-being of the employees at risk. For this reason, implementing best practices, especially in [industrial cleaning](#), is necessary to keep everyone safe.

One of which involves creating an effective cleaning plan. "Creating a plan allows industrial cleaners to define their goals and the actionable steps they need to take to achieve them. That said, the plan should include a concrete timeline and a detailed list of tasks to keep everything clear and organised," stated by Day&Night Services' general manager.

He further added, saying, "However, before a plan can be developed, cleaners must first do an initial inspection and assess the situation of every facility. Their findings will dictate their scope of work and the required frequency of their services. With this in mind, they can formulate an effective plan that targets all issues to keep the facility in the best condition possible."

Factories and power plants are much larger than regular offices or commercial establishments. Because of this, it will require sufficient labor force to make sure that all areas are addressed and properly cleaned. That being the case, identifying cleaning zones should be part of every company's plan.

According to the company's general manager, "By creating cleaning zones, every employee

understands what their role is to achieve optimal efficiency. Otherwise, it will take a long amount of time to accomplish a single task in such a massive facility.”

One of the biggest concerns many cleaners have when performing tasks in an industrial space is accessibility. Because many large pieces of equipment are scattered throughout the property, moving around and executing their job well can be challenging. That's why increasing accessibility should always be a consideration.

“Cleaning industrial buildings requires carrying heavy-duty tools like a pressure washer and an industrial vacuum. Hence, if accessibility is hindered, performing tasks will be more difficult, thereby affecting the quality of services. As such, every cleaner must ensure that there’s enough space for movement to conduct their tasks most productively,” explained the general manager.

Once the tasks are carried out, the final step is to monitor and report accordingly. The job doesn't end once the cleaning is done. Cleaners still have to do consistent monitoring to check the efficiency of the methods used through re-inspections and client feedback.

Monitoring is key to helping an Industrial Cleaning Company continuously improve its services.
