MemoBrick, one of the best toys of 2021

Miami, Florida Dec 10, 2021 ([Issuewire.com](http://www.Issuewire.com)) - MemoBrick's advantages for your child's development

MemoBrick, one of the best toys of 2021, not only has sentimental and visual value, but it is also a tool

that parents like you may utilize. By putting together your own MemoBrick with your child, he will reap numerous benefits, while you will have an unforgettable piece of art to exhibit in your living room.

Discover eight advantages, as well as some helpful hints, in the sections below.

- Concentration

Is your child's attention span no more than a minute?

You're not by alone. This is a rather regular occurrence among young children.

According to child development specialists, your child should be able to concentrate for 2-5 minutes times their age. That implies a 3-year-old may be able to focus on a job for 6 to 15 minutes, whereas a 4-year-old may be able to focus for 8 to 20 minutes.

And, you know what, [MemoBricks](#) are fantastic instruments for helping children develop their focus skills.

Paying attention entails being able to concentrate on one item for an extended amount of time. Working on a MemoBrick until it's finished allows kids to focus on one job at a time.

Of course, if a task is too tough, children become frustrated and give up. However, MemoBrick is ideal for capturing and keeping your child's attention.

You might begin by assisting them in assembling the MemoBrick or by providing verbal guidance.

Then, as your child gains confidence, attempt to progressively reduce your intervention.

You should eventually be able to sit nearby and simply observe while they concentrate without your support.

- Spatial Awareness

Your child attempts to drive a toy car beneath a bridge while playing. It is clear that the bridge is too short. However, your child discovers this when the car collides with the bridge.

Your child is developing spatial awareness in this scenario.

It essentially entails being aware of yourself in space as well as how other objects relate to each other and to you. Understanding how relationships between items change when one or more of them is moved is also part of spatial awareness.

Spatial perception is extremely important when assembling your own MemoBrick.

By evaluating the colors of the pieces, children discover which ones will fit together. To find the right fit, they must rotate the pieces. They gradually learn to do this in their minds rather than by trial and error.

The link between spatial awareness and similar activities has been validated by researchers from the University of Chicago. It was discovered that 2-4-year-olds who played with a puzzle or lego-like toys enhanced their spatial awareness skills significantly more than those who did not.

Here's how you can assist the toddler in developing spatial awareness:

Assemble your [MemoBrick](#) with your child. Also, while playing, try to utilize a lot of spatial vocabularies, such as "turn, besides, above, below, between, next to, outside, to the right, to the left, etc."

When working on a MemoBrick, decide which space you want to fill. Then, give your youngster two pieces, one that will fit and one that will not. Ask them to predict which of the two pieces will fit based just on appearance, and then put their guess to the test.

- Subject-Matter Expertise

Have you ever seen a MemoBrick map? Or how about a dinosaur MemoBrick?

MemoBrick can cover a wide range of themes, assisting your youngster in learning about the world. It can assist kids to become familiar with almost everything, from geography to environments, bodily parts, and more. You are free to submit us whatever type of photo you like, not just portraiture.

Montessori programs are well-known for employing lego-style toys to teach children about botany and zoology.

You can teach your child more by discussing the images on the MemoBrick. This will increase your child's vocabulary and topic understanding, which will help them significantly in school.

- Fine Motor Skills

The plump hands of a baby struggle to grab a little toy. However, after a few bangs on the floor, they drop it. Babies are really clumsy.

Even most toddlers are incapable of pressing buttons, writing, or pouring juice without spilling.

This is because very young children are still developing their fine motor skills.

This skill requires little motions of the wrist, fingers, hands, feet, and toes.

It takes time for youngsters to develop fine motor skills. Young hands, in particular, require a lot of practice holding and moving small items accurately. This is exactly what happens when the child assembles a MemoBrick.

The MemoBrick, in particular, requires children to use the pincer grip. This is an important ability that they will need later in preschool and kindergarten to handle a pencil (or a paintbrush).

MemoBrick also necessitates that children make extremely exact movements in order for the pieces to fit together.

It can be tempting to step in and assist your child with chores requiring fine motor skills. However,

unless they want guidance, it is advisable to let them practice on their own.

So, when putting MemoBrick together, refrain from guiding your child's hand.

- Hand-Eye Coordination

Your preschooler's eyes follow the pen as it moves across the page, sending information to her brain about how to handle the pen. The pen wobbles and your child becomes disappointed since her efforts did not result in a perfect letter "b." She is gradually developing her hand-eye coordination, which is required for good handwriting.

Little children must practice this skill by putting their eyes and hands together a lot. It starts when babies learn to put their hands above their heads and put them in their mouths.

MemoBricks are very useful at improving young children's hand-eye coordination.

To solve a MemoBrick, children must carefully place the pieces. Before placing a piece, the child uses their eyes to see where it will go. Then they must direct their hands to transfer the piece to that precise location.

So, by minimizing your engagement, you may ensure that your youngster gets enough autonomous practice.

Instead of directing your child's hand, give them some helpful suggestions like "Lift the piece a little." "Wiggle the component a little till it fits," for example.

- Problem-Solving Ability

Putting together a MemoBrick presents a basic challenge. The parts are disorganized and must be arranged and assembled. This provides an opportunity to practice problem-solving abilities.

By teaching children strategies, parents and educators can help them complete a MemoBrick. Here are a few simple examples:

After dumping out a MemoBrick, instruct your child to flip all of the pieces over so that the picture side is facing up.

Demonstrate to your youngster how to recognize edge pieces. Then, initially, construct the MemoBrick's outline.

Teach the child to sort the pieces according to color or object. For example, if there is a red flower in the MemoBrick, look for red pieces and stack them.

These sorting tactics teach children how to divide a major task into smaller ones. That is a critical problem-solving skill for pupils in school.

Then, when placing MemoBrick pieces together, children must make selections as well. What if a piece isn't going to fit?

You could recommend that they flip the item over or preserve it for later. Slowly, your child will learn when to persevere and when to put a piece aside.

- Memory

MemoBrick stimulates and engages your child's thinking. This is especially helpful for short-term memory.

How does it function?

A girl may be doing a MemoBrick when she notices a flash of a color on a piece that reminds her of a color she has already seen. She swiftly locates the other piece and assembles it.

Many experiences, such as this one, can actually speed up the connections in the brain, making it more efficient.

Because children frequently assemble the same MemoBrick, they may recall which pieces go together. This is just another method for people to improve their memory.

Here are two activities that you may use to help your child's memory:

Allow the child to practice the same MemoBrick numerous times. Set a stopwatch each time to see how soon they can complete the MemoBrick. Their speed should gradually improve.

When the MemoBrick is finished, instruct your child to look at the image for one minute before closing their eyes or turning around. Then, to determine how much they remember about the MemoBrick, ask them questions about it. For example, you could inquire, "What color is the cat?"

- Self Esteem

"I did it!" exclaims your child after inserting the final piece in a MemoBrick. "Come and see," they excitedly say.

Solving a MemoBrick is a tremendously pleasant experience. All of the parts are perfectly aligned, resulting in a stunning image. What was once disorder and a shambles is now order and neatness.

Completing a project provides a sense of accomplishment. There's a sense of completion in putting that last piece in place.

When your child completes a MemoBrick, they add to their list of accomplishments, which boosts their self-esteem.

MemoBrick also provides a unique opportunity for children to complete a task on their own.

Young children require assistance with practically everything, from going to the restroom to reading books and obtaining a snack. However, they often do not require adult assistance in assembling an age-appropriate MemoBrick.

As a result, youngsters can work independently on MemoBrick. This independence boosts one's self-esteem.

If your child has never assembled a MemoBrick before, they may find it difficult to do so on their own at first.

Use a lot of positive reinforcement to help your child gain confidence. For example, after placing a piece, you could say, "You did it!"

You can also commend your child's efforts, assisting them in seeing the link between their hard work and their accomplishments. "You've been working so hard, and now you've put another two pieces together!"
