UTK joins hands with TRON to launch pledge-free mining activities

Afono, Eastern Feb 23, 2022 (Issuewire.com) - UTRUST is a revolutionary payment platform where buyers can use mainstream cryptocurrencies to transact on UTRUST. As a reliable intermediary platform, we not only provide sellers with a safe and convenient fiat currency collection channel, but also provide buyers with the best consumption services. We pioneered the use of blockchain to combine some of the best payment protection features on the market today, with the unique features of our UTRUST token. The goal is to create a comprehensive payment application interface (API) for the market and have the ability to become PayPal's competitor in the crypto payment industry.

As the only token of the UTRUST platform, the key difference between UTK and other tokens is the business model behind it - the payment system behind it allows you to spend independently, which is a platform that has a synergistic effect with the token. Whenever a buyer pays any cryptocurrency through the UTRUST platform, a portion of the transaction fee will be used to buy back UTK and remove it from the market. These withdrawn UTKs are destroyed, reducing the supply of UTKs and driving demand, encouraging adoption of the platform, and increasing its value to sponsors. The higher the number of transactions on the UTRUST platform, the higher the potential market value of UTK. Since part of the transaction fee will be withdrawn from the pool of each market transaction, according to the built-in adjustment of the internal self-regulation mechanism.

Currently, UTRUST cooperates with TRON to start the no-staking mining activity. In TokenPocket, Imtoken, BitKeep, and other wallets deposit USDT into the TRC20 link, and enter the official website of the UTK no-staking mining platform through the DAPP browser. The platform will automatically give away 1400 G every day. Energy, participating in one mining will consume 700G energy, G energy cannot be accumulated, and reset the next day. By sharing and inviting a new wallet address to participate in the activity, you can get an additional 700G energy.

Staking 100-1000 USDT, each mining will get about 1% (estimated) income of the holding amount.

Staking 1001-5000 USDT, each mining will get about 2% (estimated) income of the holding amount.

Staking 5001-15000 USDT, each mining will get about 3% (estimated) income of the holding amount.

Staking 15001-50000 USDT, each mining will get about 5% (estimated) income of the holding amount.

Staking 50001-100000 USDT, each mining will get about 7% (estimated) income of the holding amount.

Staking 100001-200000 USDT, each mining will get about 10% (estimated) income of the holding amount.

Earnings are distributed with equivalent UTK as a reward. After receiving UTK, your wallet must have a small amount of TRX as a handling fee to exchange USDT, and automatically transfer it to your wallet, which will be received within one legal working day. Participate in mining to perform node verification on each transaction on the public chain to ensure the efficiency, fairness, security, and stability of blockchain transactions.

Since UTK was listed on Binance Exchange at the end of 2017, the circulation has exceeded 4.5 billion, and the market value is 130 million US dollars. This event has a wide range of dissemination and full discounts. It is foreseeable that the price of UTK will appreciate sharply in the near future, and the opportunity to enter the market is rare. , please customers to seize the opportunity!
