

IP2Location announced the release of new IP2Location.io IP Geolocation API

IP2Location.io provides a fast and accurate IP Geolocation API tool to determine a user's location and use the geolocation information in different use cases.

Sarasota, Florida May 8, 2022 ([IssueWire.com](https://www.issuewire.com)) - IP2Location is excited to announce the launch of a new microservice, IP2Location.io IP geolocation API. The new microservice, REST API, enables users to easily look up geolocation and proxy data using IP addresses within their own applications. This new IP geolocation microservice is available at <https://www.ip2location.io/> for immediate signup.

There are 4 different subscription plans available in IP2Location.io, namely the Free Plan, Starter Plan, Plus Plan, and Security Plan. The Free Plan allows up to 30,000 queries for free every month. The response message consists of basic geolocation data such as country, region, city, ZIP code, latitude, longitude, time zone, and ASN.

The Starter Plan, Plus Plan, and Security Plan are the paid subscription plans. These plans offer higher query limits with enriched data sets. The Starter Plan allows users to make up to 150,000 queries per month. In addition to the basic geolocation data, it also comes with advanced geolocation data sets such as ISP, domain, net speed, IDD code, area code, weather station code, weather station name, elevation, and usage type.

The Plus Plan and Security Plan are the only plans that are offering comprehensive proxy data, such as the last seen, proxy type, threat, and proxy provider names. The Plus plan allows users to query up to 300,000 times per month. Meanwhile, the Security plan allows users to query up to 600,000 times per month. Both plans include the data of mobile carrier codes, mobile brands, and other add-on data points. The Security Plan has all the information of the Plus Plan and additional advertising category data.

All paid subscription plans are equipped with overage features. Our system will automatically replenish credits by invoking the overage charges when the credits run out. This is to ensure no disruption to the web service. However, the service will be halted immediately after running out of credits in the Free Plan.

Powered by AWS and CloudFlare infrastructure, we have set up multiple servers across the globe to bring the service closer to you and greatly reduce the latency time of REST API calls. This feature is available for both free and paid subscription plans.

Please visit <https://www.ip2location.io> to learn more about the service.
