MM72. A swap dedicated to solving the Non Performing Tokens problem is born.

The current exponential rise of ICOs and the resulting growing attractiveness to millions of investors around the world has also resulted in major losses filling investors' wallets with trillions of worthless tokens.

Chicago, Illinois May 7, 2022 (Issuewire.com) - **MM72** is a Bep-20 token mined on the Binance Smart Chain Blockchain. The same will be the first asset with which all the non-performing (shit) coins and tokens can be effectively exchanged.

An immense amount gave the continuous crypto scams that continue to unfold and fill the wallets of users with **trillions of worthless tokens**.

The algorithm of the tool related to the usability of the MM72 token instead promises the swap of shit coins with values from a minimum of 10 to a maximum of 100 times the ascertained value (which in MM72 can never be absolute zero).

This algorithm allows you to decline the airdrop logic of the just listed tokens into advantages for users and in fact revive latent availability on your wallets.

A concept that takes its cue from the multi-trillion dollar banking market of trading on NPL (Non-Performing Loans) which, when transferred to a crypto environment, becomes NPT or **Non Performing Tokens**.

The mined quantity of MM72 Tokens is limited to 100 Billions of which almost 90% is destined by the logic of staking, loyalty and liquidity mining to favor the benefits to users who want to convert their Non-Performing Tokens portfolio with MM72s.

The listing of the MM72 token will take place on 14 May 2022 at 14:00 UTC on tokpie.io and promises absolutely significant performances.

The initial listing value will be set at $ 0.005. **Suffice it to say that in the test phase the token reached the value of almost $ 10**.
