

## Logit.io Launches Improvements To Alerting & Monitoring

**Manchester, United Kingdom Jul 1, 2022 ([IssueWire.com](https://www.issuewire.com))** - Logit.io, the popular observability platform for metrics, traces, and [log management](#), announced today that they have launched further improvements to the platform's alerting and monitoring features.

This latest release of the Logit.io platform offers our users an improved workflow to assist with their productivity on the platform as well as a more updated intuitive user interface (UI). Existing users of the platform will also notice improvements to the user experience (UX) as running and testing alerts will be noticeably more performant to run than in previous iterations of the SaaS platform.

Users of the platform will also be able to experience further peace of mind when it comes to creating alerts as newly created alerts are now saved immediately as drafts. By offering autosaving as a feature on the alert configuration screen, users will find it easier to collaborate with their team if they wish to hand off alert configuration to another engineer that they are working with. Users will also have the choice of whether they want to apply to alert changes immediately or keep them as a draft for future reference.

For those users who have many alerts running from a single stack, the new addition of a "last tested" indicator will be a helpful visual reminder to let the user know when a test last ran successfully.

Logit.io's recent alerting improvements have been built with user experience (UX) as a vital consideration of the development process and as a result, prioritises the most essential features for alerting and monitoring prominently.

This new release to improve the alerting features of the Logit.io platform is just one of the many platform upgrades that the team at Logit.io are launching this year, with releases such as the addition of [hosted OpenSearch](#) and [OpenSearch Dashboards](#) having already gone live in recent months.

These enhancements are offered as part of Logit.io's increased effort to ensure that their users have the features they require to ensure complete analysis and management of their data whether this data is events, logs, traces, or time-series metrics.

"We know how popular the platform alerting and notifications are to our customers, so our teams have been analysing in detail how we can make the collaborative process of building alerts more seamless," said Kieran Southern, Chief Product Officer at Logit.io. "We've aimed to eliminate some key pain points for our customers and provide faster feedback to the user, reducing the time it takes to configure alerting for your teams."

Users new to the Logit.io platform can get started with a free 14-day trial today with no credit card required and can also benefit further by getting 20% off any annual plan when they subscribe: <https://bit.ly/3zUG4Hj>
