Agra, Uttar Pradesh Jul 8, 2022 ([Issuewire.com](https://www.issuewire.com)) - With the launch of 5G, the world will be more closely connected to each other, but there will still be a shortage of doctors in the healthcare sector. Digital Health, Artificial Intelligence, and Robotics have reached the pinnacle. But timely management of most critical medical concerns is still in the infancy stage. It is almost impossible to have all kinds of specialist doctors everywhere, and it is equally impossible not to have diseases. Healthcare concerns are rampant in the smaller towns and are spreading swiftly as these geographies clearly lack access to specialist medical services.

To address this, [a medical startup Sensoriom](#) is reshaping these small-town medical concerns by [installing satellite clinics](#). [Dr. Navneet Goyal](#), the Managing Director of the company, believes that if a small polyclinic for specialist doctors could be set up in these small towns, the management of multiple chronic diseases can be done effectively. **Dr. Navneet Goyal** is an Anesthesiologist & Intensivist based

in Agra, with a decade-long experience in handling medical emergencies.

“I have come across mismanaged operations in healthcare almost every day. Sensoriom is all about correcting the malformed channels.” Says Dr. Navneet Goyal, “Through innovative collaboration, we can be sure to bring a few stable channels like specialist OPDs, eHDU, and faster cardiac diagnosis in the semi-urban and rural areas.”

Even today lakhs of people have to shunt to the city only for basic diagnostic tests and specialist care. Many people have to get admitted to city hospitals due to serious illnesses, and lakhs of rupees and months are spent on that. By making these polyclinics or satellite clinics eHDU, the cost and burden of the diseases can be reduced.

Sensoriom's new satellite clinic has started from Kasganj city. This clinic is built in partnership with Jain Nursing Home, located at a prominent landmark, Nadrai Gate. Many specialist doctors will visit every week to extend their specialist medical services. In addition to this satellite, the clinic will also have an eHDU, where patients with serious conditions could be treated through innovative devices and telemedicine. Here an innovative ECG device designed by Tricog Health India will also be included for quick and reliable cardiac screening and diagnosis.

Sensoriom is also on a healthcare mission to [mass screen the population for hidden cardiac illnesses](#) under the banner **#PreventHeartAttacks**. This mission has started from Agra and will move towards more core untouched areas across the city.

The major medical specialist doctors who will either visit in person to these satellite clinics or attend through telemedicine are Diabetes, Heart, Infertility (IVF), Gastroenterology, Neurology, and Urology. These specialist doctors will continue to provide their specialist OPD services to these satellite centres on a rotational basis. Along with this, a critical care team led by **Dr. Navneet Goyal** will also help the critical patients through telemedicine use.
