

Certified Used Phone Businesses are Now Overcoming Some of the Catastrophe Environmental Issues

Dallas, Texas Nov 14, 2022 ([Issuewire.com](https://www.issuewire.com)) - Dallas, Texas: November 14, 2022. Phone Daddy has become one of the top 5 recycling companies in Dallas by processing 50,000 smartphones for reusable condition and selling them to the US consumer directly with a warranty. "Our end users mostly comprise of young kids, elderly, and teenagers as they would like to have some affordable phone so that they can play games or stay in touch with family and friends without costing them arms and legs

Smartphones have become an indispensable part of people's daily lives in the modern world, enabling us to communicate effectively using all the affordances they have. With the development of technology, more and more activities people perform are becoming digitalized, and smartphones are a critical tool for giving people access to those activities.

Yet, it is important to remember that cell phones are more than just apps you use and pictures you swipe. They are made of various metals that can be dangerous to the environment if not recycled. According to United Nations, we throw about [20 and 50 million metric tons of e-waste annually](#). Most of this waste is sent to developing countries which has become a significant problem. The tons of e-waste shipped to the developing world not only damages the health of residents there, causing cancer and affecting child's brain development, but also produces transport waste that, in turn, damages the environment. Often the toxic chemicals pollute water, air, and soil which can threaten the survival of some habitats in those areas.

The number of cell phones on the planet is growing five times faster than the Earth's population. By the

end of 2020, [78.05 % of the world's population was using smartphones](#). With the rising demand for smartphones, the smartphone industry is expected to reach USD 493.13 billion by 2026 (statista.com).

Toxic materials and precious metals are used in manufacturing mobile phones, and it is crucial to handle them in cell phones properly. Although the facts and statistics about the impact of e-waste on the environment seem a bit scary, the good news is that over 90 % of the materials used in mobile phones can be recovered and turned into new ones. The production of cell phones already damages the environment to some extent, and by sending the old cell phones to landfills instead of recycling them, that harm is doubled.

As the demand for and supply of cell phones increases, more old phones end up in landfills. The rising impact of human activities on the environment and ecosystem created business opportunities for people concerned about decreasing environmental damage. A cell phone recycling business often offers customers the opportunity to get some money in exchange for their old phones, which will later be recycled.

Businesses like Phone Daddy work to build trust and desire for renewed devices to leave a positive impact on the environment. Phone Daddy is a certified phone recycler for [used iphone](#) that works toward environmental sustainability and gives new life to old phones by renewing and restoring their damaged parts.
