apps so you can be sure that your app is a hit without any risk. Get in touch with one of our experts today to get to know more about how [Poulima™ Infotech](#) can help bring your app idea to life!

What are the Major Trends in Mobile App Development?

Mobile apps are the future of technology, and it is not just because they are convenient to use. Mobile apps are changing the way we do business and how we interact with people.

[Mobile app development services](#) have become a vast industry that has seen a lot of changes over the years. The following trends will shape what mobile app development looks like in the future.

- 1) **More Apps for Smartphones:** As smartphones have become more popular, developers have been creating more apps for these devices.
- 2) **More Complex Apps:** It is no longer enough for an app to be simply functional - it must be engaging as well. This means that many apps now include games or other types of entertainment to make them more interesting to use.
- 3) **Businesses Using Mobile Apps:** A business can't afford to have a mobile app if they want their customers or employees to be reachable at all times.
- 4) **Increased Security:** With increased data breaches happening, there is an increased

Major Trend #1 - Google's Project Fi Is Pushing User Experience, Forward

Google's Project Fi has been pushing the boundaries of user experience by providing a mobile phone service that is simple, fast, and affordable.

Google Project Fi is a mobile phone service that offers an alternative to the traditional carrier model. It provides customers with a SIM card that can be switched between different networks in order to get the best coverage.

The service also provides customers with unlimited data at \$10 per gigabyte, which is cheaper than other carriers in the market. This allows Google to offer its services at lower prices, making it more accessible for many people who don't want to pay for a data plan or want better rates on their existing one. The fact that it's not tied down by contracts also makes it easier for people to switch providers if they feel like they're getting ripped off by their current carrier.

Trend #2 - Voice Controls & Virtual Assistants Will Be The Next Big Thing

In the near future, voice control software and voice assistant software will be the next big thing. These technologies are already making their presence felt in the market. Voice control software is being used in smart homes and cars to make it easier to operate them without having to use a touchscreen or other input devices. Voice assistants like Siri, Google Assistant, Alexa, and Cortana are also becoming more popular because they can be used by people of all ages and physical abilities.

Trend #3 - AR / VR is Finally Going Mainstream and Will Change the Way We Interact with Apps on Smartphones

One of the most significant trends in the world of mobile app development is AR/VR. These technologies are finally going mainstream and will change how we interact with smartphone apps. Now is the perfect time to create a mobile AR app. Here are some of the top ways to implement AR in your next app:

Trend #4 - Apps Starting to Give More Direct Access to Marketplaces

Apps are starting to give more direct access to marketplaces. This is a trend that we are seeing in the industry. This is being done so that the app user can find anything they want on the app and not have to go anywhere else. Some apps, such as Amazon, are also starting to integrate their services into other apps so that their users can get what they need without having to go through another app or website.
