Orlando, Florida Jan 4, 2023 ([Issuewire.com](https://www.issuewire.com)) - As part of the company's continuing efforts to support transformative open-source development, Concepta Technologies recently published 4 projects to GitHub: a scalable enterprise development platform (Rockets), a design system API for Flutter (Mix), a Flutter Version Management tool (FVM), and a desktop interface that supports a more rewarding Flutter development experience (Sidekick). In addition to making development easier, these projects signify Concepta's commitment to growing the open-source community.

"We've always believed that open-source brings efficiency to the testing, validation, and development of innovative new technologies. With these 4 projects, we want to do our part to contribute to this growth," said Leo Farias, CEO.

Concepta's open-source projects are built primarily with Flutter, which the organization views as an important tool for achieving the unified, multi-platform future they envision. "Flutter has already opened the door to remarkable new possibilities with mobile and web development," said Leo. "Now the technology has tests running on Toyota, Nest Hub, Apple TV, Samsung, and even Apple Watch. We want to contribute to this amazing potential by sharing our open-source code with the community."
