Supply Chain and Innovation

Efficiency in the supply chain may be significantly improved through innovative approaches. Here are five areas of the supply chain that may be improved upon to serve customers better while cutting costs:

- **Design for Manufacture:**

Create a product that is simple to mass manufacture, which will, in turn, bring down the overall manufacturing cost.

- **Design for Assembly:**

Create the product in such a way as to reduce the total number of components, which will make the assembly process simpler. This usually leads to simpler, more modular subsystems.

- **Design for Product Serviceability:**

Create a product that is simple to assemble, disassemble, and reuse its components. Products with fewer, smaller parts are often simpler to fix than those with more complex designs or those constructed with heavier elements.

- **Design for Six Sigma:**

Develop the product in a way that guarantees its reliability, uniformity, and low price. Implementing consistent component specifications throughout the whole supply chain is a classic example of a Six Sigma-friendly design.

- **Design for Environment:**

The environmental effect of the product should be minimized throughout its development and production phases. Less packaging, a tighter supply chain, and waste recycling might all play a role in achieving this goal.
