Interventional radiology is a medical specialty that performs various minimally-invasive procedures using medical imaging guidance, such as x-ray fluoroscopy, computed tomography, magnetic resonance imaging, or ultrasound. Interventional radiologists diagnose and treat disease. They treat a wide range of conditions in the body by inserting various small tools, such as catheters or wires from outside the body. X-ray and imaging techniques such as CT and ultrasound help guide the radiologist.

Diagnostic radiology is a medical specialization that involves undertaking a range of imaging procedures to obtain images of the inside of the body. Diagnostic radiologists use a variety of imaging procedures to see inside the body and assess or diagnose the patient's condition.
