

Tri Medical Therapy Announces Availability of Innovative Scrambler Therapy for Chronic Pain Management

New York City, New York Jan 21, 2024 ([Issuewire.com](https://www.issuewire.com)) - Tri Medical Therapy, Pain Management, and Trauma Center is excited to introduce [Scrambler Therapy](#), a revolutionary pain management approach, to its range of services. Located in Brooklyn and serving the community from two locations, Tri Medical Therapy is committed to providing advanced and effective solutions for those suffering from chronic pain.

Addressing the Chronic Pain Challenge

Chronic pain poses a growing challenge in the United States, with the Centers for Disease Control and Prevention (CDC) reporting that in 2021, 20.9% of U.S. adults (51.6 million people) experienced chronic pain, and 6.9% (17.1 million people) had high-impact chronic pain. Opioids are commonly prescribed for chronic pain treatment, contributing to the ongoing epidemic of Opioid Use Disorder (OUD) and

addiction on a global scale. The statistics reveal that three million U.S. citizens have or currently suffer from OUD. Given the pressing need for innovative chronic pain management methods, scrambler therapy has emerged as a promising option.

Scrambler Therapy - A New Horizon in Pain Management

Scrambler therapy is a cutting-edge treatment that uses a unique machine to block the transmission of pain signals by delivering non-painful information to nerve fibers. This method is distinct from traditional approaches like TENS (Transcutaneous Electrical Nerve Stimulation). Unlike TENS, which operates on the gateway theory of pain relief, scrambler therapy provides 'normal-self', non-pain electrical information to nerves that have been communicating chronic pain, effectively retraining the brain to disassociate pain from the treated area.

Recent Endorsement by Johns Hopkins Experts

In a recent review paper published in The New England Journal of Medicine on July 13, 2023, two experts from Johns Hopkins in pain management highlighted the effectiveness of scrambler therapy. According to their findings, this noninvasive pain treatment has been successful in providing significant relief for approximately 80% to 90% of chronic pain patients, demonstrating potential superiority over transcutaneous electrical nerve stimulation (TENS) in pain management.

Suitable Conditions for Scrambler Therapy

This innovative treatment is particularly beneficial for a variety of chronic pain conditions, including neuropathic pain, cancer-related pain, lower back pain, sciatica, post-surgical pain, and complex regional pain syndrome (CRPS). Scrambler therapy offers new hope for patients who have not found relief through conventional pain management strategies or want to cut down on pain medications.

Key Benefits of Scrambler Therapy

- **Innovative Approach:** Scrambler therapy is an electro-cutaneous treatment, delivering scrambled electrical signals that the brain interprets as normal, non-pain signals.
- **Retraining the Brain:** The therapy capitalizes on neural plasticity, teaching the brain to no longer recognize certain areas as sites of chronic pain.
- **High Success Rate:** As per a recent review by Johns Hopkins pain experts, published in The New England Journal of Medicine, scrambler therapy has shown significant relief in approximately 80%-90% of chronic pain patients.
- **Significant Reduction in Analgesic Consumption:** Research demonstrated a 72% decrease in analgesic consumption, including opioids, antidepressants, and anticonvulsants, when using Scrambler therapy.
- **Non-invasive and Effective:** This therapy offers a non-invasive alternative to traditional pain management methods, with potentially longer-lasting results. The procedure begins by identifying the pain or neuropathy area. Leads are placed on normal sensation skin sites near the affected area. The machine then sends scrambled signals to the brain, creating a buzzing sensation that replaces the pain. Each session lasts about 30 minutes, with the potential for lasting pain relief after a series of treatments.

Why Choose Tri Medical Therapy for Your Treatment?

At Tri Medical Therapy, Pain Management, and Trauma Center, we pride ourselves on our patient-

centric approach, integrating the latest technologies and personalized care plans to ensure the most effective treatment for each individual. Our team of highly qualified professionals, including specialists in pain management and trauma care, are dedicated to not only treating pain but also understanding and addressing its root causes. By choosing Tri Medical Therapy, patients benefit from a multidisciplinary approach that combines state-of-the-art treatments like Scrambler Therapy with comprehensive rehabilitation services, all under one roof.

About Tri Medical Therapy, Pain Management, and Trauma Center

Tri Medical Therapy, Pain Management and Trauma Center is a leading healthcare facility in Brooklyn, New York, specializing in advanced pain management, trauma care, and rehabilitation services. Their team of skilled professionals is dedicated to providing compassionate and comprehensive care to patients, ensuring a quick and effective recovery process.
