RISK FACTORS OF GUM DISEASE

Healthy Gum **Gingivitis** **Periodontitis**

- Age** Higher than the chance for disease control and the chance of disease control is higher in older patients.
- Smoking** Smoking has been linked with gum disease and is a major risk factor for periodontitis.
- Diabetes** Diabetes and those at risk of developing diabetes can be at the highest risk for periodontitis. It is important to keep blood sugar levels under control.
- Medications** Certain prescription medications, including some blood thinners, anti-depressants, and oral contraceptives, can increase your gum disease risk.
- Poor Nutrition** If you have poor nutrition, that can give the bacteria in the mouth and make it easier to develop.
- Teeth Grinding or Clenching** Teeth grinding or clenching is a common habit that can lead to gum disease. This can weaken your teeth, making them more susceptible to gum disease.
- Genetics** If your family has a history of gum disease, you may be at a higher risk for developing gum disease. This can be passed down from your parents.
- AIDS & HIV** Individuals with HIV and AIDS are at a higher risk of developing gum disease. This is because the immune system is weakened, making it easier for bacteria to grow.
- Hormonal Changes** Women are more at risk of developing periodontitis during or after pregnancy. This is because hormone levels are higher.
