

eukhost Launches Internationally Located Dedicated Servers

Leading hosting provider, eukhost, has launched its new range of Managed Dedicated Servers, a solution that enables customers to host their dedicated servers at data centres in Holland, USA, Canada, Japan, India and Australia, as well as in the UK.

North Yorkshire, United Kingdom Jul 16, 2024 ([IssueWire.com](https://www.issuewire.com)) - The leading independent hosting provider, eukhost, has launched its new range of Managed Dedicated Servers, a solution that enables customers to host their dedicated servers at data centres in Holland, the USA, Canada, Japan, India, and Australia, as well as in the UK.

Extending the choice of geographical hosting locations provides eukhost customers with several important benefits. With the server located closer to a customer's online visitors, latency is reduced, leading to faster website loading times. Website and application performance are also improved, resulting in quicker response times which are particularly important for resource-intensive websites and apps, including those that offer gaming, video streaming, or real-time communication tools.

Reduced latency also means online transactions can take place quicker, as the proximity of the server reduces the processing time, making checking out more efficient and reducing shopping cart abandonment. Overall, the reduced latency and faster data transfers improve the user experience and help keep visitors engaged.

As website speed is an SEO ranking factor, nearby server locations can positively impact a website's SEO performance, leading to better search rankings. Importantly, hosting data in the same region or country as the target audience can also aid in compliance with data protection regulations. This ensures adherence to local data sovereignty laws and boosts trust among users.

Robert King, Managing Director of eukhost commented, *"We are very excited at the launch of our International Dedicated Servers. They are a clear demonstration of our dedication to delivering first-class hosting solutions to clients worldwide and a reflection of our ongoing commitment to innovation and addressing the ever-changing needs of businesses around the world. It provides our clients with the capability to expand on a global scale, ensuring a dynamic and diverse digital presence."*

eukhost customers now have the option to use servers based closer to their audiences in Europe, Asia, Australia, and North America. Those with a global user base, meanwhile, can have dedicated servers in multiple locations, enabling them to establish a global presence with improved accessibility and which delivers superior user experience.

Robert King added, *"It's not just the location of the International Dedicated Servers that brings advantages, we've also made sure that the hardware and our managed services are of top quality too."*

To ensure top-tier performance, eukhost exclusively offers enterprise-server grade CPUs from Intel and AMD across the entire server range, coupled with storage based on SSD or NVMe for lightning-fast data access and retrieval, with data loss prevention through RAID. Additionally, all servers, regardless of location, are fortified with cutting-edge security measures, including continuous performance monitoring to ensure data integrity. There is also no resource sharing, with the dedicated servers being completely isolated from other users - a key distinction between VPS and Cloud.

As a 24/7 managed solution, eukhost's server management scope is designed for flexibility, extending

support beyond the standard services provided by other hosts. Round-the-clock server monitoring, meanwhile, ensures that the team can respond swiftly to any issue detected by the monitoring system, often before users are even aware of it. 24/7 technical support comes as standard, ensuring an expert is always on hand to deal with any problems.

Launched in January 2024, eukhost's International Dedicated Servers are now available to new and existing customers around the world. For more information, visit: <https://www.eukhost.com/international-dedicated-servers>.
