

PriusMED launches new medCLOUD 2025 platform for Enhanced Clinical Collaboration

new medBRIDGE wearable relay adds flexibility

Rolling Meadows, Illinois Jun 4, 2025 ([Issuewire.com](https://www.issuewire.com)) - PriusMED is pleased to announce the launch of its newest medCLOUD 2025 platform and its associated medBRIDGE wearable device. Designed to transform the landscape of Emergency Medicine, Mobile Integrated Health, and Hospital-at-Home, this platform provides a Virtual Emergency Room environment where real-time streaming of patient vitals alongside participant video & audio enables seamless collaboration among healthcare professionals at all stages in healthcare delivery.

Now with support for 12-lead ECG streaming (a first in the industry), this platform ensures that critical patient vitals are instantaneously shared with the best-qualified medical professionals available, enabling specialist assistance of patients much earlier in the continuum of care.

In addition to its robust streaming capabilities, medCLOUD incorporates features such as **interactive clinical annotations**, **high-resolution ECG snapshots**, and **multiple analyses stored directly on the recording timeline**. This functionality facilitates a comprehensive review process for medical teams after patient care.

To further enhance healthcare productivity, the platform is designed to **seamlessly integrate as a plug-in module of current Healthcare Informatics platforms**, eliminating the need for multiple logins, dual data entry, and subsequent data uploads into downstream applications such as EPCR, EHR, billing, etc. In the Mobile Integrated Health space, medCLOUD is already available as a HealthCall module; other integrations will follow.

The new medBRIDGE product further enhances this platform by offering a **wearable relay that supports a range of devices**, including streaming-enabled vital signs monitors and various digital accessories such as body cameras, digital stethoscopes, and ultrasound. This flexibility allows medBRIDGE to integrate with existing systems and adapt to future devices, thus accommodating a broad spectrum of clinical needs.

Targeting emergency medicine professionals, mobile integrated health teams, and hospital-at-home services, PriusMED invites stakeholders in the healthcare sector to explore the advantages of these cutting-edge solutions. With the increasing demand for efficient remote clinical assistance, medCLOUD with medBRIDGE is poised to elevate patient care and enhance operational effectiveness in critical care situations.

"medCLOUD will change the way outpatient medicine is practiced today. Unifying the currently fragmented ecosystem comprised of device-centric solutions and diverse Hospital Information Systems, our groundbreaking platform provides a seamless, vendor-independent unified experience by combining multi-participant audio and video telepresence with real-time streaming of patient vitals.", said Dan M. Mihai, President of PriusMED.

"In the prehospital market, EMS and Fire agencies nationwide will both be able to utilize a full picture of patients' waves and arrive at clinical decisions faster in an environment where every second counts. We like being the pace setters for the industry, and hope that by pioneering 12-lead ECG streaming, a major hurdle in telehealth adoption can be overcome.", added Michael A. Jahns, CEO of PriusMED.

For more information on capabilities and advantages of medCLOUD with medBRIDGE, interested professionals are encouraged to visit our website www.priusmed.com.

About medCLOUD

medCLOUD is a patented real-time clinical collaboration platform used to stream, broadcast, and record via a standardized high-speed protocol audio, video, and patient vitals (parameters, trends & waveforms) sourced from a patient-connected monitoring device to enable multi-participant remote clinical assistance of a first responder with interactive case annotation and subsequent review of recorded cases.
