

LEXTRACK AI Partners with University of Colorado Boulder for Capstone Project to Build App Generator

Collaboration will empower CU Boulder students to design, deploy, and monetize custom AI-powered social media mini-apps—no coding required.

Berkeley, California Aug 11, 2025 ([IssueWire](https://www.issuewire.com)) - LEXTRACK AI, a pioneer in Synthetic Generative Intelligence (SGI), Artificial Superintelligence (ASI), and Human Ontology (H-ONT), has announced a Capstone Project partnership with the **University of Colorado Boulder**. This collaboration will see CU Boulder students develop the **Lex Social Media App Generator**—a no-code

platform enabling anyone to build, fork, host, monetize, and discover AI-powered social media mini-apps.

The platform merges composable building blocks (categories + add-ons), automated backend provisioning (Firebase + optional compute), and a unified AI-powered app store to streamline the app creation process—from idea to deployment—while embedding social interaction and flexible monetization options.

Key Capstone Deliverables Include:

- A functional AI agent that translates prompts into deployable AI app scaffolds.
- A no-code app builder with live preview and branding controls.
- Automated backend setup for authentication, database, and storage.
- Fork/remix/repost mechanics with attribution tracking.
- An AI app store with search, filtering, recommendations, and creator dashboards.
- Stripe-powered payment options for one-time purchases, subscriptions, and in-app transactions.

CU Boulder’s capstone team—mentored by LEXTRACK AI’s leadership—will receive high-touch guidance, daily scrums, and access to internal platform demos, treating students as integral members of the tech team.

“Working with CU Boulder’s talented students allows us to accelerate innovation while giving them real-world experience in AI, no-code development, and cloud deployment,” said **Nicolas He Tian Hunter**, Founder of LEXTRACK AI.
