

Energy-Backed Digital Yield Model Drives IO DeFi's 2025 Global Expansion

New global nodes, reinforced security layers, and expanded infrastructure position IO DeFi for accelerated international growth.

San Francisco, California Nov 27, 2025 ([Issuewire.com](https://www.issuewire.com)) - IO DeFi, a global provider of decentralized computing infrastructure, announced its largest system upgrade of 2025, designed to meet the growing global demand for cloud-based blockchain services. The upgrade includes expanding node deployments, enhancing system resilience, and building a multi-layered security architecture to support the platform's expanding international ecosystem.

The past year has seen a resurgence in cloud computing and decentralized computing, driven by growing interest in alternative blockchain infrastructure solutions. IO DeFi's latest update comes at a time of record-high global user numbers, prompting the company to enhance its capacity and scalability to serve millions of active users across more than 180 regions.

The expanded infrastructure includes new running nodes in North America, Europe, and Asia, significantly improving latency stability and cross-regional system performance. These new nodes enhance the platform's distributed network and create a more reliable environment for users requiring continuous computing resources.

A company representative noted that this upgrade reflects IO DeFi's long-term strategy: to provide transparent, verifiable, and security-oriented infrastructure. To support this goal, the platform now integrates advanced protection layers such as the Cloudflare® Smart Routing Architecture, McAfee® Threat Intelligence Monitoring, and a strengthened DDoS attack mitigation framework.

With accelerated adoption and an increasing number of infrastructure-grade partners, IO DeFi anticipates continued growth in 2025. The company confirmed that more feature releases, global system improvements, and new technology collaborations are scheduled for the coming months.

About IO DeFi

IO DeFi is a blockchain technology company focused on decentralized computing infrastructure, distributed node systems, and enterprise-grade security architecture. The platform currently serves users in over 180 countries, providing transparent and security-centric blockchain solutions.
