

Industry leader for Mold in America says HVAC System Products are to Blame

According to a leading Mold expert, the high grains per pound of moisture, constantly pumping through HVAC, plenums and ductwork in the hot summers dumped tons of moisture in the absorbent insulation board the duct is made from, a crucial mistake!

Florida Ridge, Florida Dec 24, 2025 ([IssueWire.com](https://www.IssueWire.com)) - A Fungus, Among Us! The Harmful Truth for why Mold is Growing in HVAC Ducts throughout Millions of American Homes!

Urgent health warning: A longstanding issue with approved HVAC duct materials—particularly internal fiberglass liners—is fueling mold growth in countless U.S. homes, turning your air conditioning system into a potential source of contaminated air. Black Ops Specialty Services' Mold division <https://www.BlackOps-USA.com> is doing something about it for America.

These porous fiberglass insulations, widely used and code-approved for decades, absorb the cool and high GPP moisture from AC systems, creating dark, damp conditions ideal for mold. Dust accumulation provides food, leading to microbial growth that releases spores and irritants into your breathing air.

The EPA states that once fiberglass-lined ducts become mold-contaminated, cleaning is often ineffective—no EPA-registered biocides exist for these porous materials. Experts recommend removal and replacement of affected sections.

This isn't rare: Inspections conducted frequently each day reveal mold in about 50% of ductwork, especially in humid climates or poorly maintained systems. While not every home is affected, the risk is significant where moisture control fails.

Musty odors from vents, worsening allergies, or high humidity (65%+) could signal trouble. Experts urge vigilance!

Act now—schedule a professional HVAC inspection to protect your family's air quality. Prevention through moisture control is key until this product is banned.
