## Why Deleted Photos Are Not Always Lost

When photos are deleted from an Android device, they are usually not erased immediately. Instead, the operating system marks the storage space as available for new data. Until that space is overwritten, recovery remains possible. This is why acting quickly after deletion significantly improves the chances of successful recovery.

### Photos may be lost due to:

- Accidental deletion
- Clearing gallery or cache files
- App crashes or software updates
- Storage cleanup or file manager actions

Understanding how deletion works helps users make better recovery decisions.
