

Logical Commander Expands Ethical AI Platform for Internal Risk and Integrity Prevention Under Full U.S. Regulation

The Israeli technology company sets a new standard for ethical, non-intrusive internal risk and insider threat prevention, aligned with U.S. labor and compliance regulations

DC, Washington Jan 30, 2026 ([Issuewire.com](https://www.issuewire.com)) - Logical Commander Software, an Israeli technology company specializing in advanced internal risk prevention, announced the expansion of its AI-powered platform **E-Commander** across the Americas, with growing adoption by organizations seeking to strengthen **internal risk management, insider risk prevention, integrity, ethics, fraud prevention, and corporate governance** in a compliant and responsible manner.

Organizations operating in today's complex business environment face increasing exposure to **internal risks linked to human behavior**, including insider risk, ethical breaches, conflicts of interest, internal fraud, and governance failures. These risks often materialize gradually, remain undetected by traditional controls, and escalate into financial, operational, legal, or reputational crises. Reactive approaches, fragmented tools, and post-incident investigations are no longer sufficient to address these challenges effectively.

E-Commander provides organizations with a centralized platform to identify, contextualize, and prioritize **early internal risk indicators**, enabling structured and timely decision-making. The platform supports enterprise-wide coordination across **Human Resources, Compliance, Risk Management, Security, Internal Audit, and executive leadership**, delivering a unified view of internal risk exposure while maintaining clear governance and accountability.

A core component of the platform is **Risk-HR**, designed to surface **early indicators related to integrity, ethics, and insider risk** without asserting wrongdoing, intent, or individual acts. Risk-HR is not a fraud detection tool, does not conduct interrogations, and does not make determinations about truthfulness or guilt. Instead, it provides **objective, policy-aligned indicators** that support preventive action, structured review, and informed human decision-making.

Unlike intrusive or interrogation-based technologies, Logical Commander's solutions are built around principles of **ethical AI, proportionality, transparency, and respect for employee rights**. The platform is notably **the only solution in its category designed from the ground up to be fully**

compliant with the U.S. Department of Labor's Employee Polygraph Protection Act (EPPA).

In accordance with EPPA requirements, the platform **does not attempt to detect deception, does not assess veracity, does not apply psychological pressure, does not classify individuals, and does not automate disciplinary or employment decisions**. Logical Commander's technology explicitly avoids practices that could resemble polygraph testing or coercive assessments, ensuring lawful use in U.S. employment environments.

This compliance-first approach has positioned Logical Commander as a trusted partner for organizations operating in **highly regulated sectors**, including finance, insurance, government contractors, logistics, retail, and critical infrastructure, where employee protections and governance standards are paramount.

The platform's development and strategic oversight are supported by a **world-class Board of Advisors**, composed of former senior government officials and subject-matter experts with decades of experience in **governance, ethics, integrity, insider threat prevention, national security, and institutional oversight**. The advisory board provides independent guidance to ensure the platform aligns with real-world regulatory, ethical, and operational expectations.

Following successful deployments with large enterprises and public-sector institutions across Latin America and other regions, Logical Commander is expanding its presence in the U.S. market through a growing **partner and reseller ecosystem**, enabling localized expertise while maintaining consistent global standards for ethics, compliance, and governance.

"Our mission is simple," said **Matias Schapiro, Chief Executive Officer of Logical Commander**. "**Know first. Act fast.** We help organizations transform early internal risk signals into structured, ethical, and timely decisions—before issues escalate into major incidents."

By combining early risk visibility, structured governance, and strict regulatory alignment, Logical Commander enables organizations to move from reactive responses to **proactive, ethical internal risk prevention**, without compromising employee rights or organizational integrity.

Logical Commander Software Ltd.

An Israeli technology company specializing in ethical, non-intrusive prevention of internal risk, insider risk, integrity, ethics, fraud exposure, and corporate governance through artificial intelligence.

Organizations seeking to strengthen **internal risk prevention, insider risk management, integrity, ethics, and compliance**—while operating fully within U.S. labor and regulatory frameworks—are invited to contact Logical Commander to learn how **E-Commander** supports structured, informed decision-making at scale.

Logical Commander also invites **qualified partners and resellers** seeking to **lead commercial expansion in the U.S. market** to connect with us and explore partnership opportunities around **ethical, fully compliant internal risk and integrity prevention**.

Organizations and partners interested in learning how **E-Commander** supports structured, informed decision-making—**under full U.S. regulatory alignment**—are encouraged to get in touch.
