

Card One Advances Payment Security with AI and Encryption Technologies

Advanced fraud prevention and data protection now built into every Card One transaction

Plano, Texas Feb 2, 2026 ([Issuewire.com](https://www.issuewire.com)) - Card One, a provider of payment processing and gateway technology, has introduced enhancements to its security platform designed to protect businesses against modern fraud and data theft. The upgraded system combines artificial intelligence, advanced tokenization, and end-to-end encryption to create a safer payment environment across all transaction types.

With the new framework, sensitive cardholder information is never exposed or stored in its original form. Instead, transaction data is converted into secure digital tokens, while encryption safeguards information from the moment a payment is initiated through final authorization and settlement. This approach reduces the risk of data breaches and unauthorized access.

Artificial intelligence now plays a key role in preventing fraud before it causes damage. Card One's AI-driven monitoring analyzes every transaction in real time, identifying unusual activity, evolving fraud patterns, and suspicious behavior as it happens. Machine learning models continuously update themselves, enabling the system to stay ahead of emerging threats rather than reacting after losses occur.

These enhancements create a more secure payment experience for both in-store and online transactions, reducing exposure to sensitive data and strengthening overall protection for businesses and their customers.

"Fast payments are essential, but smart security is even more important," said Alex Hemmat, Board Member and Consultant at Card One. "By combining artificial intelligence with tokenization and encryption, we're giving merchants in retail, hospitality, healthcare, and other industries the tools they need to stay ahead of cybercrime while protecting their customers and revenue."

The upgraded security platform integrates easily with existing point-of-sale systems, virtual terminals, and e-commerce gateways. Businesses can activate the enhanced protections without replacing equipment or disrupting daily operations, making it simple to upgrade to a higher level of payment security.

About Card One

Card One delivers merchant services, credit card processing, and secure payment gateway solutions to businesses across the United States. The company supports a wide range of industries, including retail, e-commerce, hospitality, restaurants, healthcare providers, medical practices, and hospital networks.
