

Developer Launches Free Wordle Solver Using Advanced Mathematical Algorithm

Md Sahadat Husain, a web developer and computer engineer, has launched Wordle Solver (wordlesolver.fun), a free online tool that uses mathematical algorithms to help players solve the daily Wordle puzzle more efficiently.

New York City, New York Feb 15, 2026 (IssueWire.com) - Md Sahadat Husain, a web developer and computer engineer, has launched Wordle Solver (wordlesolver.fun), a free online tool that uses mathematical algorithms to help players solve the daily Wordle puzzle more efficiently.

The solver works by analyzing the colored feedback from each guess—green for correct position, yellow for right letter/wrong spot, and gray for letters not in the word—then filters through the official Wordle word list to suggest the best next moves. Unlike other word helpers that simply show word lists, this tool uses information theory and probability calculations to recommend words that eliminate the most possibilities with each guess.

"Most Wordle solvers just pick common words," says Husain. "What makes this different is the mathematical approach. The algorithm measures how much information you gain from each guess and suggests words that narrow down the options fastest."

The platform includes several features designed to help players improve their game:

- Real-time filtering through all 2,315 possible Wordle answers

- Instant suggestions based on letter placement and frequency
- Mobile-friendly design that works on phones, tablets, and desktops
- Completely free with no registration or subscription required
- Additional resources like best starting words and full word lists

Since launching, the site has attracted users looking to either solve difficult puzzles or learn better strategies. The tool also includes educational content about letter frequency patterns and optimal word selection.

"I wanted to create something that wasn't just a cheat sheet but actually helps people understand the logic behind solving these puzzles," Husain explains. "You can use it when you're stuck, or you can study the patterns to get better at the game."

The platform also features:- Analysis of best Wordle starting words (CRATE, SLATE, TRACE)- Searchable database of all valid Wordle words- Word lists organized by starting/ending letters- Tips and strategies for consistent solving

Husain, who works as a Web Developer at WPManageninja LLC, built the solver using React and TypeScript with an emphasis on speed and simplicity. The entire word-matching algorithm runs in the browser, making it fast even on slower connections.

The tool is available now at wordlesolver.fun with no account needed. Users can start solving immediately by entering their guesses and clicking the tiles to match the colors shown in their Wordle game.

For players who want to maintain their streak but need occasional help with tricky words, or for those learning to improve their strategy, Wordle Solver offers a practical middle ground between struggling alone and giving up.
