

Dr William Braun Brings Expertise in Bariatric and Upper GI Surgery to Queensland Patients

Brisbane, Queensland Feb 3, 2026 ([IssueWire.com](http://www.IssueWire.com)) - Patients in Queensland searching for specialist care for weight-related health concerns and upper gastrointestinal (GI) disorders can now

access expert services through [Dr William Braun](#). A dedicated and seasoned specialist general surgeon with advanced training in minimally invasive and laparoscopic techniques.

Bariatric and metabolic surgery for eligible patients

Dr Braun evaluates patients who might require bariatric (metabolic) surgery. This type of surgery may help with weight loss. It may also alleviate conditions associated with obesity. These can be type 2 diabetes, sleep apnoea, high blood pressure, reflux, and fatty liver disease. Not everyone can undergo surgery. The evaluation of patients is thorough. Medical history is reviewed. Discussed are risks and benefits. Clinical need and safety are used to make decisions.

Patients are assisted systematically. This involves pre-operative preparation. It also entails postoperative monitoring. Follow-up is significant in long-term outcomes. It assists patients in nutrition, lifestyle, and activity change management. It also helps detect problems early. Care is made to be realistic and understandable.

Upper GI surgery and digestive health care

Dr Braun also treats upper GI disorders. These may involve the oesophagus and the stomach. Patients can consult about reflux symptoms. They can also be characterised by chronic pain or other gastrointestinal issues. The purpose of assessment is to establish the cause of symptoms. There is patient-centered treatment planning. The pathways of care are supposed to be evidence-based and safe.

Surgery for upper GI conditions often requires intricate decision-making. It might involve integrated investigations. It can also include long-term follow-up. The model developed by Dr. Braun includes a clear communication model and action plans. This is aimed at helping patients understand what is going on. It also makes the patients know what is to come next.

Minimally invasive techniques and endoscopy services

One of the major aspects of Dr. Braun's practice is laparoscopic surgery. This uses small incisions. It can facilitate the healing of appropriate patients. Less invasive procedures can help to save hospital time. They can also minimise the interference with ordinary life. The choice of procedure is determined by the patient's condition and overall health.

Endoscopy services are also offered by Dr Braun. These involve gastroscopy and colonoscopy. Endoscopy may help in diagnosis. It can also inform treatment choices. It is frequently used when symptoms require further research. It can verify the need for surgery. It may also help in planning the safest way.

Common general surgical conditions

The practice also handles common surgical issues. These are hernia and gallbladder disease. Digestive symptoms are common in many patients with such conditions. Some of the symptoms are similar to those of upper GI problems. Synchronised testing can help minimise delays. It also helps simplify investigations and treatment.

Referral pathway and coordinated care

Patients are often referred to a GP. The practice facilitates consultation with the doctors who refer patients. There is also the aspect of care, which involves allied health support where necessary. This can involve food instructions and lifestyle planning. Follow-up is a key part of care. This is particularly necessary for patients undergoing bariatric surgery. Continuous monitoring facilitates safety and long-term results.

About Dr William Braun

Dr Braun is a Fellow of the Royal Australasian College of Surgeons (FRACS) and has doctoral-level academic training. His surgical background encompasses progressive laparoscopic practice and a long-standing interest in procedures aimed at recovery with the least invasive methods.
