

Homebro Announces Official Launch of Its All-in-One Coliving Management App

Nantes, Loire-Atlantique Feb 13, 2026 ([Issuewire.com](https://www.issuewire.com)) - Homebro, a France-based technology startup, announced the official launch of its mobile application designed to centralize and simplify daily life in shared housing environments.

The launch marks a key milestone for the company as it enters the consumer market with a platform specifically developed for roommates and coliving households. As shared housing continues to expand in major urban centers, the need for structured digital tools tailored to collective living arrangements has increased.

Homebro was created to address operational challenges commonly experienced in shared apartments, including expense tracking, document storage, secure password sharing, and fragmented communication across multiple applications. The company states that its objective is to provide a unified mobile platform that supports the administrative and practical aspects of living with roommates.

The application enables users to track shared expenses, record payments, calculate balances, and manage reimbursements within a defined household group. A secure document vault allows roommates to store lease agreements, insurance policies, receipts, and other administrative documents in one centralized location.

The platform also includes a code vault feature designed to securely store and share household access information such as Wi-Fi passwords and building entry codes. Built-in messaging supports group and

private conversations within the context of the shared home, reducing reliance on external communication platforms.

Additional features include a shared mailbox for housing-related correspondence and a shared accounts overview that helps households monitor recurring services such as utilities and streaming subscriptions. Notifications and reminders are integrated to keep users informed about financial updates and shared responsibilities.

To encourage participation within shared homes, the application incorporates interactive elements including mini-games and an internal story feed. A points-of-interest map allows users to save and reference nearby services relevant to their residence.

“The launch of Homebro represents an important step toward building structured digital infrastructure for coliving,” said Mo, Founder of Homebro. “Shared housing is increasingly common in urban areas, yet the available tools have not been designed specifically for the daily coordination needs of roommates.”

The company indicated that product development will continue throughout 2026, with feature enhancements and potential platform expansions under evaluation.
