

ADAAS unveils A-Concept, a new AI-ready framework for ultra fast and reliable software development

Istanbul, Turkey Mar 25, 2026 ([Issuewire.com](https://www.issuewire.com)) - ADAAS announced the introduction of **A-Concept**, an AI-ready framework developed for a new reality in which artificial intelligence is no longer only a supporting tool, but an active participant in software delivery.

Built through **two years of research and development**, supported by **more than 5 million lines of tested code**, and combined with ADAAS's **proprietary AI model for code generation**, A-Concept is designed to help businesses build new software products and modernize existing platforms with greater speed, consistency, and architectural reliability.

As AI becomes more deeply integrated into engineering workflows, many businesses are discovering that traditional development approaches and frameworks were not designed for this shift. Teams increasingly face challenges such as missing architectural context, implementation drift, delivery bottlenecks, and systems that are difficult for AI to extend reliably in production environments.

A-Concept was created to address that challenge. The framework introduces a more structured and AI-ready foundation for software delivery, helping both engineering teams and AI systems work within clearer boundaries, stronger architectural logic, and a more consistent internal structure.

According to ADAAS, A-Concept is already delivering strong production results when combined with the company's proprietary AI model, helping accelerate both the creation of new products and the modernization of existing systems.

“We are already seeing real results in production. What conventional software development could take years to achieve, we can now accomplish in weeks,” said Alex Dudka, CEO of ADAAS. “The breakthrough is not simply that AI can generate code. The breakthrough is that we can now give AI a system it can extend more reliably. That changes the speed, the economics, and the scale of what businesses can build.”

ADAAS believes this marks an important step toward a future in which more companies can become truly **AI-native** — not only by adopting AI tools, but by building the architectural foundations required to use AI in a practical, scalable, and production-ready way.

With A-Concept, ADAAS aims to help organizations move beyond experimentation and toward a more reliable model of AI-enabled software delivery.
