

## KUDI Pet Supplies Manufacturer Highlights Rising Pet Travel Trends and Hidden Risk of Car Sickness in Cats

**Arkadelphia, Arkansas Apr 20, 2026 ([Issuewire.com](https://www.issuewire.com))** - **KUDI Pet Supplies Manufacturer** is a [pet product manufacturer](#) specializing in designing and developing pet toys and accessories for global markets. With a focus on improving pet well-being through innovative product design, KUDI continues to provide practical solutions for modern pet owners.

As more pet owners choose to travel with their animals during holidays and long-distance road trips, growing attention is being placed on an often-overlooked issue: car sickness in cats.

Pet care experts note that while dogs tend to show obvious symptoms during travel—such as restlessness, vomiting, or loss of bladder control—cats often hide their discomfort. This difference in behavior can lead many owners to mistakenly assume that cats adapt easily to car rides.

According to recent pet care observations, signs of car sickness in cats are typically subtle and can go unnoticed. Common indicators include drooling, frequent lip licking, and, in more severe cases, vomiting or digestive issues. Excessive drooling may suggest discomfort linked to the nervous and digestive systems, while repeated lip licking is often an early sign of nausea.

In addition to physical symptoms, behavioral changes can also signal distress. Some cats may become

vocal and restless, moving frequently inside their carriers, while others may appear unusually quiet or inactive. Experts caution that this stillness should not always be interpreted as calmness, as it may indicate underlying discomfort.

“With the rise in pet travel, it’s important for owners to better understand how cats respond to motion and unfamiliar environments,” said a [cat care](#) specialist. “Early recognition of these subtle signs can make a significant difference in improving a cat’s travel experience.”

Preventive measures are considered essential in reducing the likelihood of car sickness. Experts recommend gradually introducing cats to car travel through short, positive trips. Avoiding heavy meals several hours before travel may also help minimize digestive discomfort.

Maintaining proper airflow within the vehicle and allowing cats to observe their surroundings can further reduce stress and motion-related discomfort. These simple adjustments can contribute to a more comfortable journey for pets.

As traveling with pets continues to grow in popularity, KUDI emphasizes the importance of awareness regarding feline car sickness and encourages pet owners to take proactive steps to ensure safer and less stressful trips.
