

White Paper Warns UK's Biggest Partnerships Are Failing Without Trust and Sets Out a 3-Point Manifesto for Change

A new white paper launched today argues that the greatest gains in public infrastructure, aerospace and technology will not come from contracts or technology alone but from how well trust is designed into strategic partnerships.

London, United Kingdom Mar 25, 2026 ([IssueWire.com](https://www.IssueWire.com)) - ***Titled Trusted Partnerships: Unlocking the Value in Strategic Alliances***, the paper shows that when trust is deliberately embedded, partnerships deliver faster decisions, stronger innovation and greater long-term value. In

complex sectors, such as aerospace, where safety, performance, and availability depend on tightly integrated supply chains, trust is already a critical operational enabler.

Survey evidence in the paper highlights strong confidence in the upside of trust-based partnerships. Over three-quarters of respondents expect at least **5% additional value**, with more than half believing the gain exceeds **10%**. Respondents consistently link this uplift to better collaboration, earlier problem-solving and reduced friction between partners.

The research shows that high-performing partnerships share common foundations: **balanced power, shared risk and joint accountability**. Where governance is shared and incentives are aligned, partnerships move faster and adapt more effectively to change, leading to improved outcomes and greater innovation in their collaborative efforts, such as the development of new products or services that meet emerging market needs.

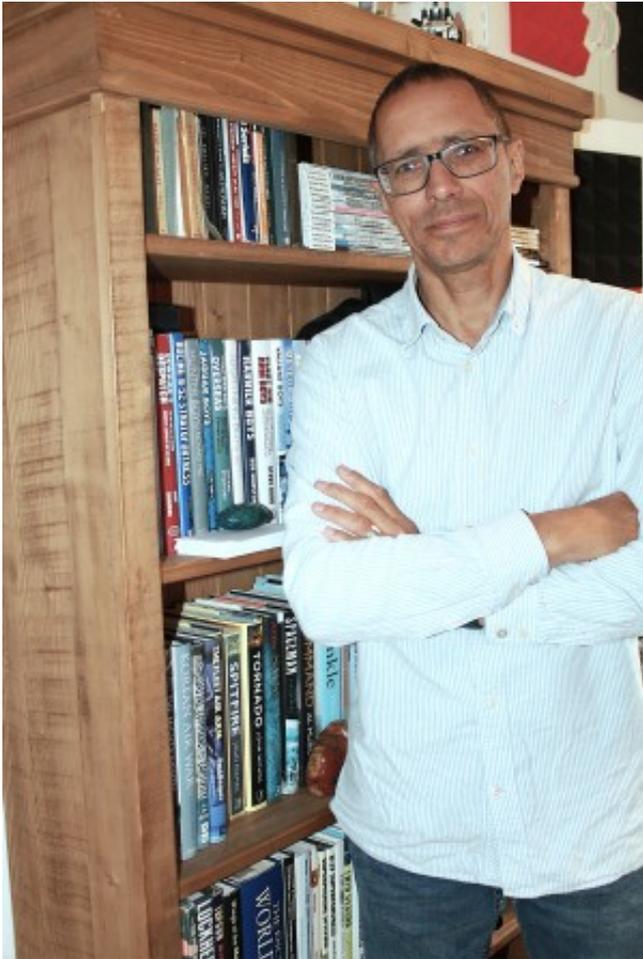

“Where power is unequal, trust cannot thrive,” the paper states. “And where trust is absent, performance inevitably declines.”

The paper also finds that many partnerships still fall short of this standard. While labeled strategic, too many remain transactional in practice, constrained by imbalances of power and one-sided risk transfer. These structural issues, rather than capability gaps, are shown to be the main source of delay, cost escalation, and missed opportunity in projects, particularly in sectors where power dynamics heavily influence decision-making and resource allocation.

To move from insight to action, the paper sets out a clear **three-point manifesto for leaders across public infrastructure, aerospace and technology**:

- **Place greater weight on partnership capability** *in evaluating proposals.*
- **Design Trust into contracts** - *trust cannot exist without fairness.*
- **Hold leaders accountable for Trust** - *not just short term delivery.*

As fiscal pressure, AI disruption and political uncertainty intensify, **trust stands out as the most powerful performance lever in complex partnerships and one leaders can no longer afford to leave to chance.**
